CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

- (3) Align torque converter to oil pump seal opening.
- (4) Insert torque converter hub into oil pump.
- (5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

TORQUE CONVERTER (Continued)

(6) Check converter seating with a scale and straightedge (Fig. 235). Surface of converter lugs should be 19mm (0.75 in.) to the rear of the straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

Fig. 235 Typical Method Of Checking Converter Seating

1 - SCALE
2 - STRAIGHTEDGE

TORQUE CONVERTER
DRAINBACK VALVE

DESCRIPTION

The drainback valve is located in the transmission cooler outlet (pressure) line.

OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

STANDARD PROCEDURE - TORQUE
CONVERTER DRAINBACK VALVE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates significant amounts of sludge and/or clutch particles and metal shavings, the valve must be replaced.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.

TOW/HAUL OVERDRIVE
SWITCH

DESCRIPTION

The tow/haul overdrive OFF (control) switch is located in the shift lever arm (Fig. 236). The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

81244870

Fig. 236 Tow/Haul Overdrive Off Switch

TOW/HAUL OVERDRIVE SWITCH (Continued)

OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once causes the tow/haul overdrive OFF mode to be entered and the Tow/Haul lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the tow/haul lamp to be turned off. The tow/haul overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the tow/haul overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

DIAGNOSIS AND TESTING - OVERDRIVE ELECTRICAL CONTROLS

The tow/haul overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

REMOVAL

(1) Using a plastic trim tool, remove the tow/haul overdrive off switch retainer from the shift lever (Fig. 237).

812448d1

Fig. 237 Tow/Haul Overdrive Off Switch Retainer

(2) Pull the switch outwards to release it from the connector in the lever (Fig. 238)

812448cb

Fig. 238 Remove the Tow/Haul Overdrive Off Switch
INSTALLATION

NOTE: There is enough slack in the wire to pull out the connector from the lever.

(1) Pull the connector out of the lever just enough to grasp it.

CAUTION: Be careful not to bend the pins on the tow/haul overdrive off switch. Use care when installing the switch, as it is not indexed, and can be accidentally installed incorrectly.

(2) Install the tow/haul overdrive off switch into the connector (Fig. 239)

81244ade

Fig. 239 Install the Tow/Haul Overdrive Off Switch

(3) Push the tow/haul overdrive off switch and wiring into the shift lever.

(4) Install the tow/haul overdrive off switch retainer onto the shift lever.

TRANSMISSION RANGE SENSOR

DESCRIPTION

The Transmission Range Sensor (TRS) (Fig. 240) has 3 primary functions:

- Provide a PARK/NEUTRAL start signal to the engine controller and the starter relay.
- Turn the Back-up lamps on when the transmission is in REVERSE and the engine (ignition) is on.
- Provide a transmission range signal to the instrument cluster.

80a3ad99

Fig. 240 Transmission Range Sensor

The sensor is mounted in the transmission housing near the valve body, just above the pan rail. It's in the same position as the Park/Neutral switch on other transmissions. The TRS contacts a cammed surface on the manual valve lever. The cammed surface translates the rotational motion of the manual lever into the linear motion of the sensor. The cammed surface on the manual lever is comprised of two parts controlling the TRS signal: The insulator portion contacts the switch poppet when the manual lever is not in PARK or NEUTRAL. The manual lever itself contacts the poppet when the lever is in

PARK or NEUTRAL; providing a ground for the signal from the starter relay and the JTEC engine controller.

OPERATION

As the switch moves through its linear motion (Fig. 241) contacts slide across a circuit board which changes the resistance between the range sensing pins of the switch. A power supply on the instrument cluster provides a regulated voltage signal to the switch. The return signal is decoded by the cluster, which then controls the PRNDL display to correspond with the correct transmission range. A bus message of transmission range is also sent by the cluster. In REVERSE range a second contact set closes the circuit providing power to the reverse lamps.

2	2	2	The transmission is hydraulically in Manual SECOND.	In the SECOND gate.
1	1	1	The transmission is hydraulically in Manual FIRST.	In the FIRST gate.

DIAGNOSIS AND TESTING - TRANSMISSION RANGE SENSOR (TRS)

NOTE: For all circuit identification in the following steps, Refer to the appropriate Wiring Information.

- (1) Raise vehicle on suitable hoist.
- (2) Disconnect the vehicle's shift cable from the manual lever.
- (3) With the manual lever in the PARK position (the PARK position is with the manual lever moved to the full rearward position), measure the resistance between the Park/Neutral Position Sense pin of the TRS and the transmission case. The resistance should be less than 5 ohms.
- (4) With the manual lever in the NEUTRAL position (the NEUTRAL position is with the manual

lever moved two detents forward of the full rearward position), measure the resistance between the Park/Neutral Position Sense pin of the TRS and the transmission case. The resistance should be less than 5 ohms.

(5) If the resistance is greater than 5 ohms in either of the previous steps, check for a dirty contact between the tip of the TRS rod and the valve body manual lever. If the contact is OK, replace the TRS.

(6) With the manual lever in the REVERSE position (the REVERSE position is with the manual lever moved one detent forward of the full rearward position), measure the resistance between the Fused Ignition Switch Output and the Back-up Lamp feed pins of the TRS. The resistance should be less than 5 ohms. If the resistance is greater than 5 ohms, replace the TRS.

TRANSMISSION RANGE SENSOR (Continued)

(7) With the manual lever in the PARK position (the PARK position is with the manual lever moved to the full rearward position), measure the resistance between the Transmission Range Sensor MUX and the Transmission Range Sensor 5V Supply pins of the TRS. The resistance should be 522.2 ohms. If the resistance is not correct, replace the TRS.

(8) With the manual lever in the REVERSE position (the REVERSE position is with the manual lever moved one detent forward of the full rearward position), measure the resistance between the Transmission Range Sensor MUX and the Transmission Range Sensor 5V Supply pins of the TRS. The resistance should be 206.2 ohms. If the resistance is not correct, replace the TRS.

(9) With the manual lever in the NEUTRAL position (the NEUTRAL position is with the manual lever moved two detents forward of the full rearward position), measure the resistance between the Transmission Range Sensor MUX and the Transmission Range Sensor 5V Supply pins of the TRS. The resistance should be 108.6 ohms. If the resistance is not correct, replace the TRS.

(10) With the manual lever in the DRIVE position (the DRIVE position is with the manual lever moved three detents forward of the full rearward position), measure the resistance between the Transmission Range Sensor MUX and the Transmission Range Sensor 5V Supply pins of the TRS. The resistance should be 59.9 ohms. If the resistance is not correct, replace the TRS.

(11) With the manual lever in the SECOND position (the SECOND position is with the manual lever moved one detent rearward of the full forward position), measure the resistance between the Transmission Range Sensor MUX and the Back-up Lamp feed pins of the TRS. The resistance should be 31.9 ohms. If the resistance is not correct, replace the TRS.

(12) With the manual lever in the LOW position (the LOW position is with the manual lever moved to the full forward position), measure the resistance between the Transmission Range Sensor MUX and the Back-up Lamp feed pins of the TRS. The resistance should be 13.7 ohms. If the resistance is not correct, replace the TRS.

REMOVAL

(1) Raise vehicle and position drain pan under the transmission range sensor (TRS).

(2) Move the transmission manual lever to the manual LOW position. The manual LOW position is with the manual lever in the forward-most detent.

(3) Disengage the wiring connector from the TRS.

(4) Remove the two screws holding the TRS to the TRS mounting bracket.

(5) Remove the TRS (Fig. 242) from the TRS mounting bracket by pulling it straight out of the bracket.

(8) Refill the transmission fluid to the correct level.

TRANSMISSION TEMPERATURE SENSOR

DESCRIPTION

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor (Fig. 248). The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 2000 ohms.

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

Fig. 248 Governor Pressure Sensor

- 1 - GOVERNOR BODY
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

OPERATION

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The Tow/Haul lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

VALVE BODY

DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 249), (Fig. 250), (Fig. 251), and (Fig. 252):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure sleeve
- Kickdown valve
- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- 3-4 shift valve
- 3-4 timing valve
- 3-4 quick fill valve
- 3-4 accumulator
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch lock-up valve
- Converter clutch lock-up timing Valve
- Shuttle valve
- Shuttle valve throttle plug
- Boost Valve
- 9 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

CHECK BALLS

CHECK BALL NUMBER	DESCRIPTION
1	Allows either the manual valve to put line pressure on the 1-2 governor plug or the KD Valve to put WOT line pressure on the 1-2 governor plug.
3	Allows either the Reverse circuit or the 3rd gear circuit to pressurize the front clutch.
4	Allows either the Manual Low circuit from the Manual Valve or the Reverse from the Manual Valve circuit to pressurize the rear servo.
5	Directs line pressure to the spring end of the 2-3 shift valve in either Manual Low or Manual 2nd, forcing the downshift to 2nd gear regardless of governor pressure.
6	Provides a by-pass around the front servo orifice so that the servo can release quickly.
7	Provides a by-pass around the rear clutch orifice so that the clutch can release quickly.
8	Directs reverse line pressure through an orifice to the throttle valve eliminating the extra leakage and insuring that Reverse line pressure pressure will be sufficient.
9	Provides a by-pass around the rear servo orifice so that the servo can release quickly.
10	Allows the lockup clutch to used at WOT in 3rd gear by putting line pressure from the 3-4 Timing Valve on the interlock area of the 2-3 shift valve, thereby preventing a 3rd gear Lock-up to 2nd gear kickdown.

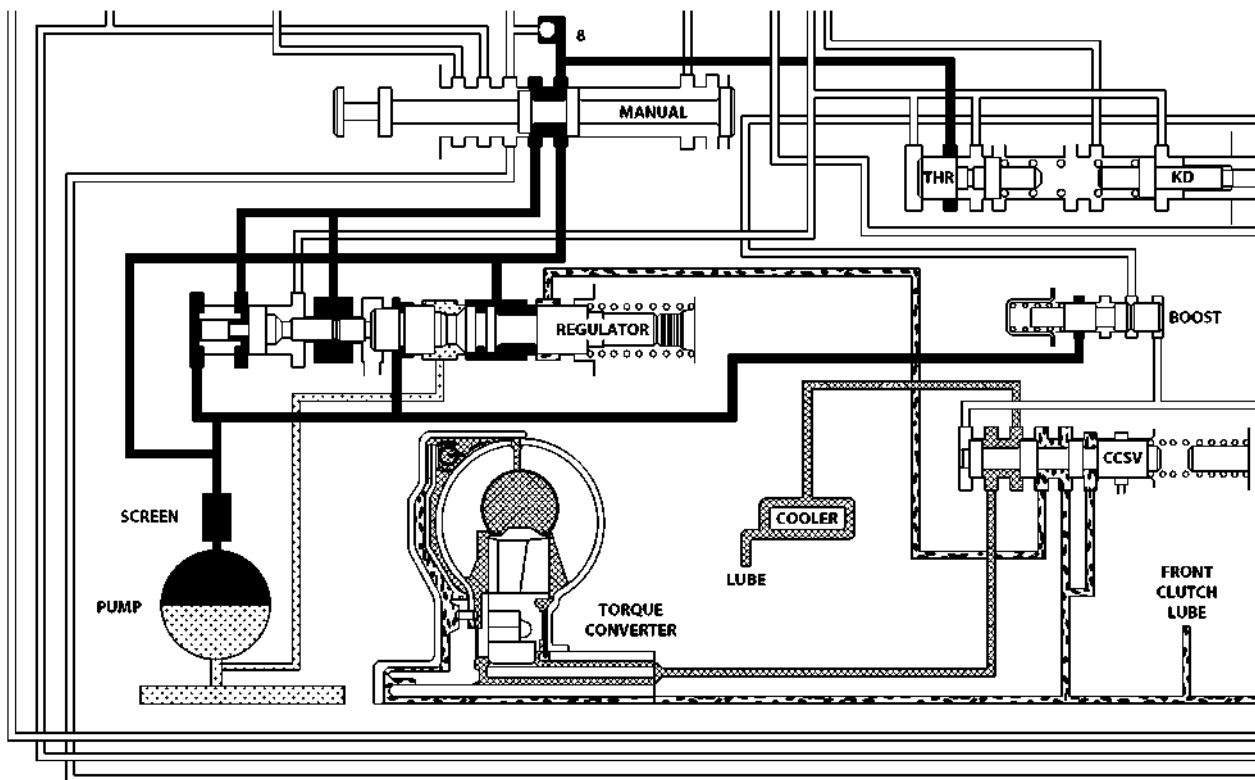

VALVE BODY (Continued)

REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as "line pressure."

The regulator valve (Fig. 253) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the

valve pushes the valve to the right, opening the dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the PARK position, fluid recirculates through the regulator and manual valves back to the sump.

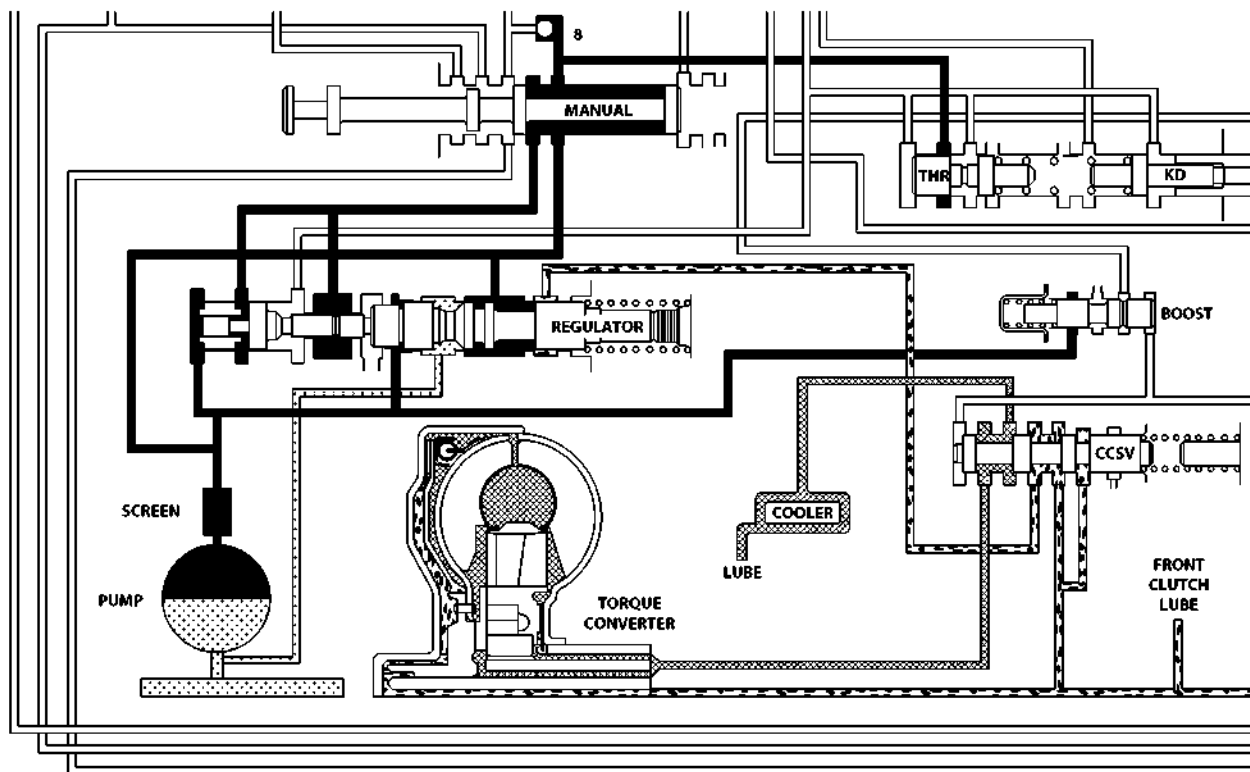

810109c7

Fig. 253 Regulator Valve in Park Position

VALVE BODY (Continued)

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 254), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

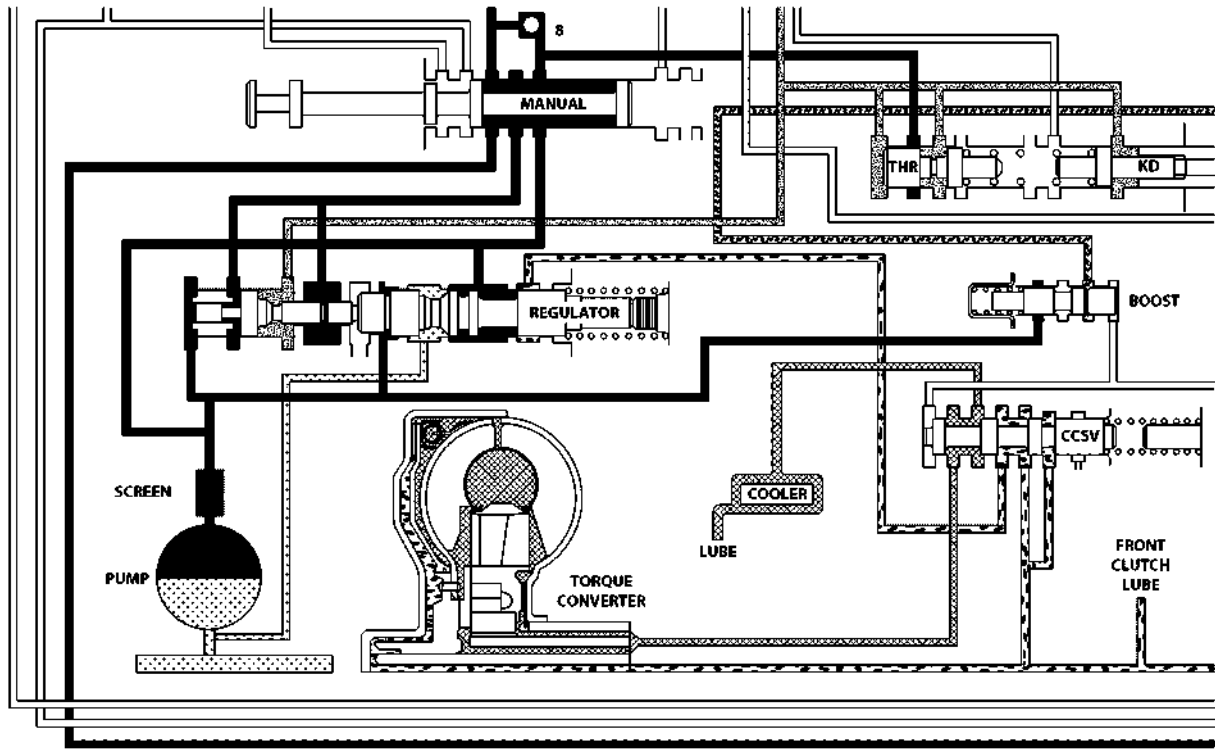

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position and the transmission's internal condition within a range of 57-94 psi (except in REVERSE) (Fig. 255). The regulated line pressure in REVERSE (Fig. 256) is held at much higher pressures than in the other gear positions: 145-280 psi. The higher pressure for REVERSE is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

VALVE BODY (Continued)

KICKDOWN VALVE

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 257) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

810109dd

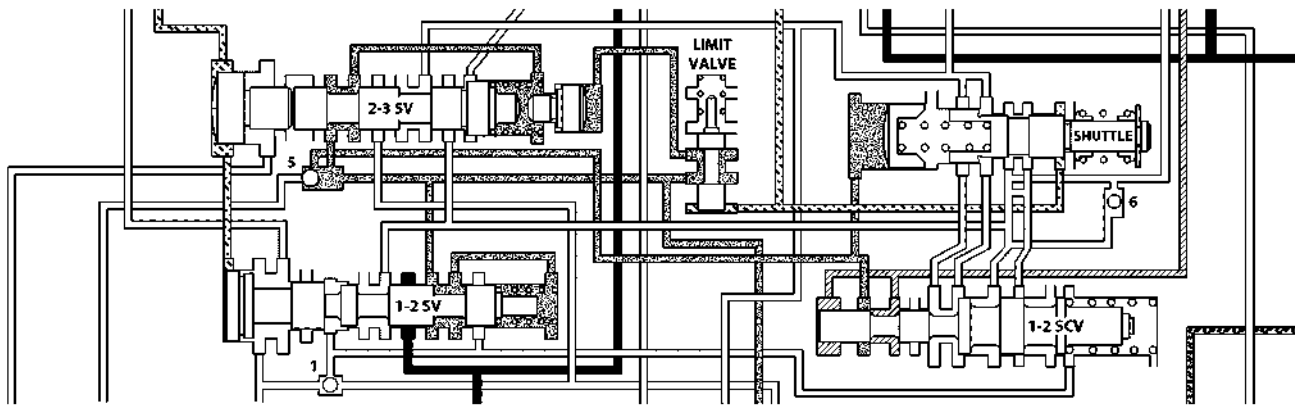

Fig. 257 Kickdown Valve - Wide Open Throttle

VALVE BODY (Continued)

KICKDOWN LIMIT VALVE

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 258) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 259), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of the limit valve overcoming the spring force trying to

push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

810109e2

Fig. 258 Kickdown Limit Valve - Low Speeds

810109e6

Fig. 259 Kickdown Limit Valve - High Speeds

VALVE BODY (Continued)

1-2 SHIFT VALVE

The 1-2 shift valve assembly (Fig. 260), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle

pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 261).

The governor plug serves a dual purpose:

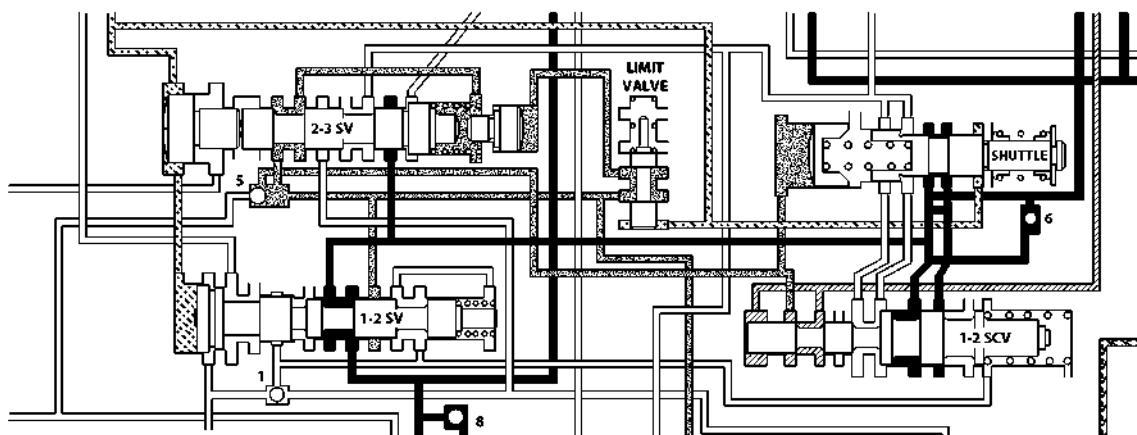

- It allows the shift valves to move either left or right, allowing both upshifts and downshifts.
- When in a manual selection position, it will be hydraulically "blocked" into position so no upshift can occur.

The physical blocking of the upshift while in the manual "1" position is accomplished by the directing of line pressure between both lands of the governor plug, pushing the plug back against the end plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

810109eb

Fig. 260 1-2 Shift Valve - Before Shift

810109ef

Fig. 261 1-2 Shift Valve - After Shift

VALVE BODY (Continued)

1-2 SHIFT CONTROL VALVE

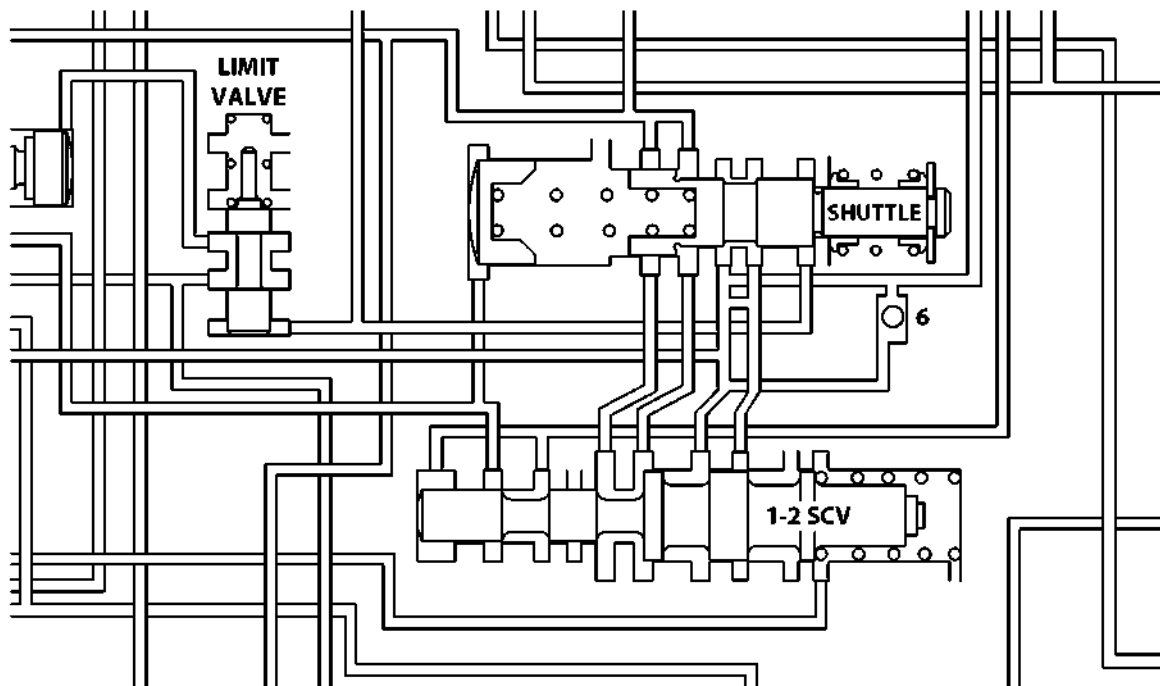

It contains a valve with four lands and a spring. It is used as both a "relay" and "balanced" valve.

The valve has two specific operations (Fig. 262):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kick-down ranges.

When the manual valve is set to the DRIVE position and the transmission is in the first or second gear range, 1-2 shift control or "modulated throttle pressure" is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kick-down servo apply pressure that is needed to apply

the kickdown and accumulator pistons. Thus, the 1-2 shift point is "cushioned" and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2 shift control valve. This additional pressure is directed to the 1-2 shift control's spring cavity, adding to the spring load on the valve. The result of this increased "modulated" throttle pressure is a firmer WOT upshift.

8101094

Fig. 262 1-2 Shift Control Valve

VALVE BODY (Continued)

2-3 SHIFT VALVE

The 2-3 shift valve mechanism (Fig. 263) consists of the 2-3 shift valve, governor plug and spring, and a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead-end at land #2 until the 2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. Since the throttle pressure end of the 2-3 shift valve is larger in diameter than the 1-2 shift valve, the 2-3 shift will always happen at a greater speed than the 1-2 shift. When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

After the shift (Fig. 264), line pressure is directed to the release side of the kickdown servo. This releases the front band and applies the front clutch,

shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual "1" or manual "2" gear selection, line pressure is sent between the two lands of the 2-3 governor plug. This line pressure at the governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

If the manual "2" or manual "1" gear position is selected from the drive position, the PCM will control the timing of the downshift by targeting for a high governor pressure. When a safe vehicle speed is reached, the PCM will switch to its normal control governor curve and the downshift will occur.

3-4 SHIFT VALVE

The PCM energizes the overdrive solenoid during the 3-4 upshift (Fig. 265). This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position (Fig. 266). This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston.

81010a09

Fig. 266 3-4 Shift Valve After Shift

VALVE BODY (Continued)

3-4 TIMING VALVE

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve (Fig. 266) or the converter clutch valve. After the shift, the timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from downshifting while either the overdrive clutch or converter clutch is applied (Fig. 265).

3-4 QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift (Fig. 265). This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a predetermined pressure develops within the clutch, the valve closes the bypass (Fig. 266). Clutch fill is then completed through the regular feed orifice.

THROTTLE VALVE

In all gear positions the throttle valve (Fig. 267) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases,

the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle speed has been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line

Fig. 267 Throttle Valve

VALVE BODY (Continued)

pressure is "metered" out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the 1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

between the input shaft and the reaction shaft, and back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

SWITCH VALVE

When the transmission is in Drive Second before the TCC application occurs (Fig. 268), the pressure regulator valve is supplying torque converter pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out

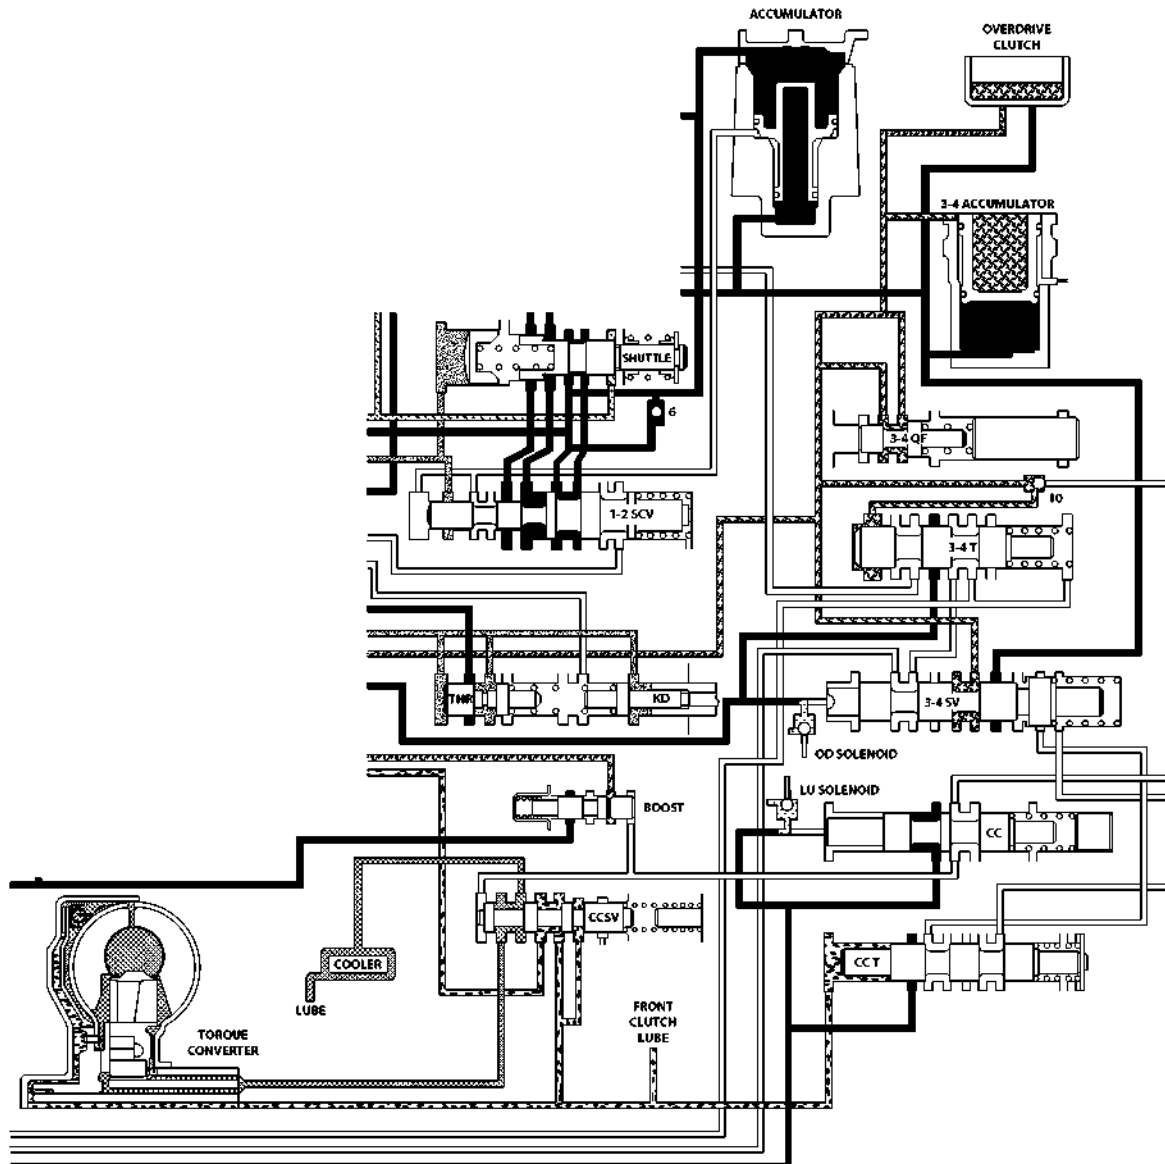

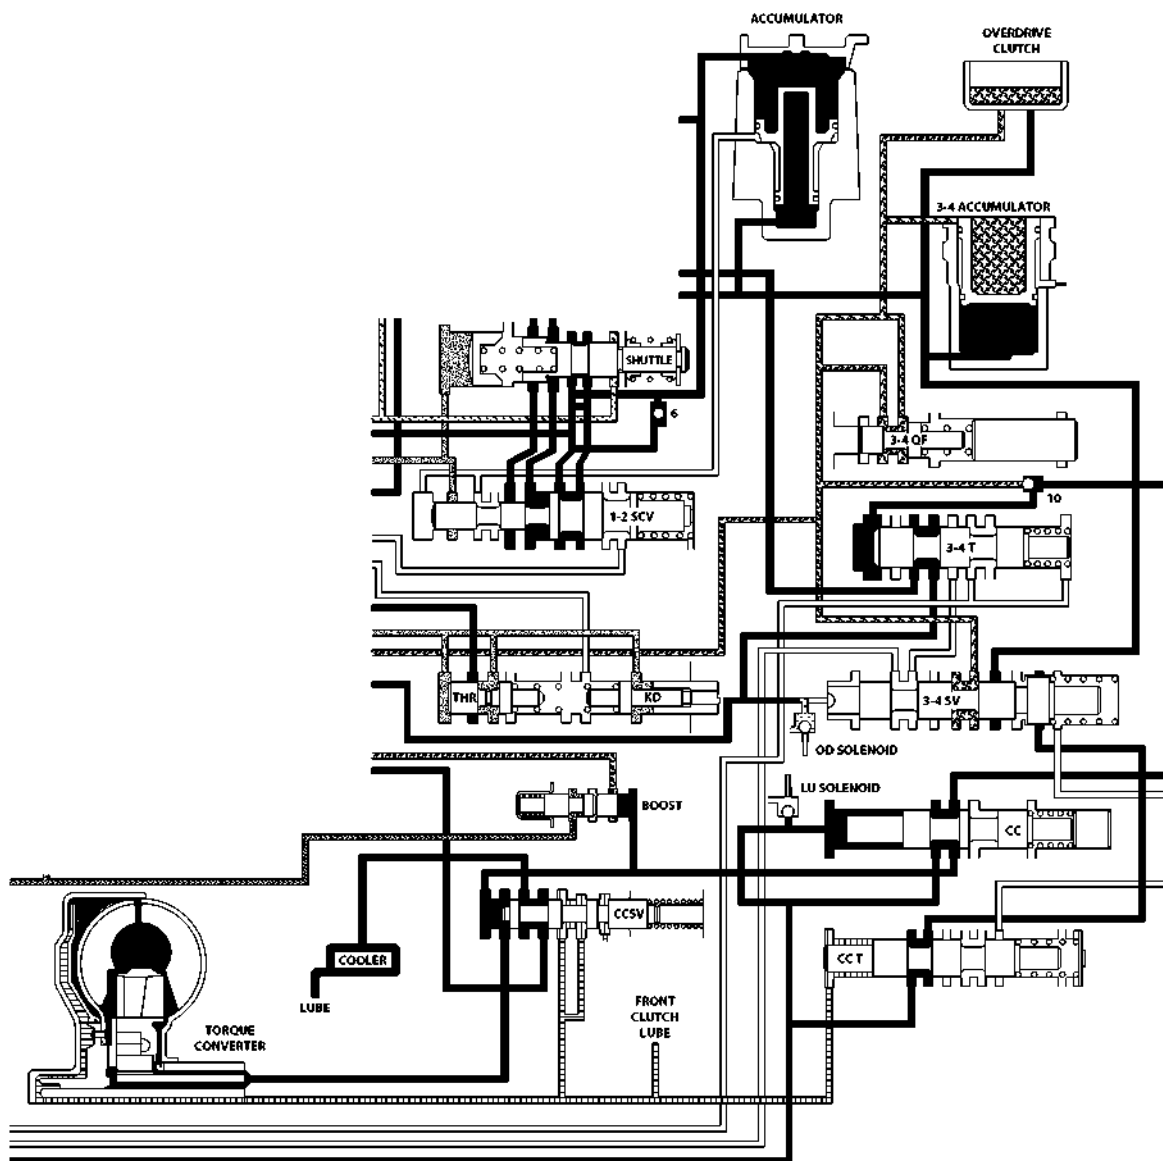

Fig. 268 Switch Valve - Torque Converter Unlocked

VALVE BODY (Continued)

Once the TCC control valve has moved to the right (Fig. 269), line pressure is directed to the tip of the switch valve, forcing the valve to the right. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled right allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

81010a48

Fig. 269 Switch Valve - Torque Converter Locked

VALVE BODY (Continued)

MANUAL VALVE

The manual valve (Fig. 270) is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the side of the valve body. The valve is connected mechanically by either a cable or linkage to the gear-shift mechanism. The valve is held in each of its positions by a spring-loaded roller or ball that engages the "roostercomb" of the manual valve lever.

CONVERTER CLUTCH LOCK-UP VALVE

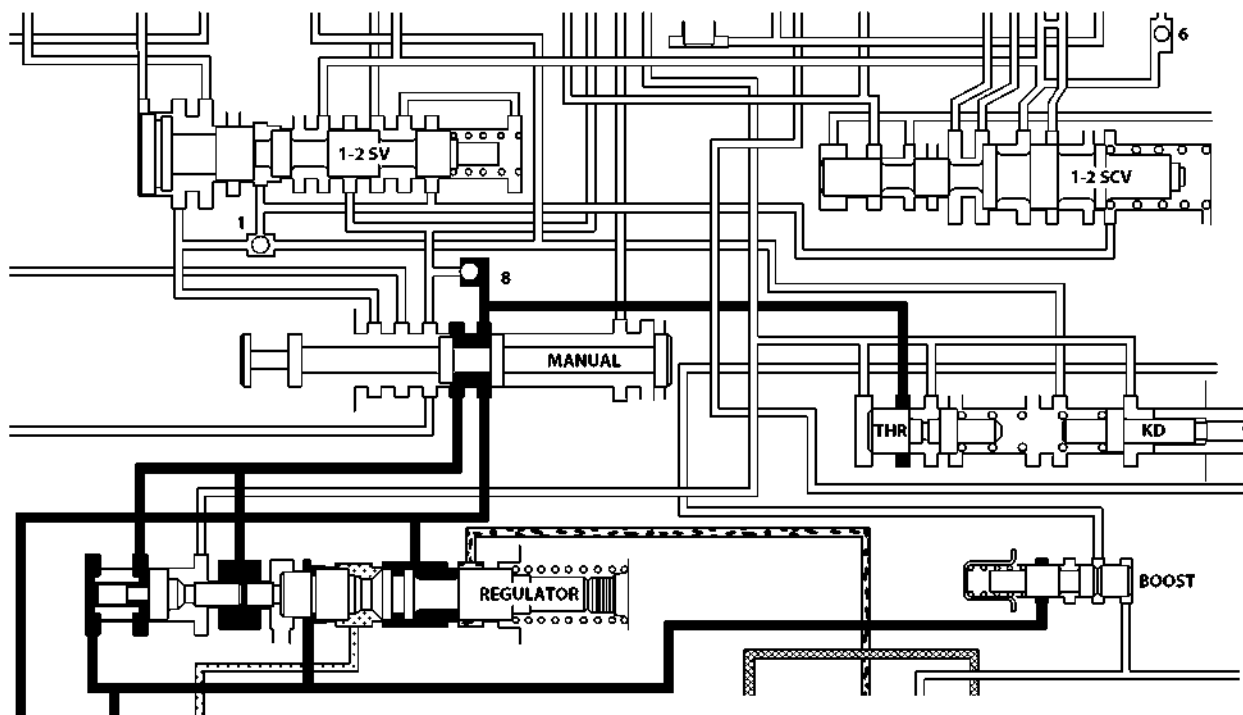

The torque converter clutch (TCC) lock-up valve controls the back (ON) side of the torque converter clutch. When the PCM energizes the TCC solenoid to engage the converter clutch piston, pressure is applied to the TCC lock-up valve which moves to the right and applies pressure to the torque converter clutch.

CONVERTER CLUTCH LOCK-UP TIMING VALVE

The torque converter clutch (TCC) lock-up timing valve is there to block any 4-3 downshift until the TCC is completely unlocked and the clutch is disengaged.

SHUTTLE VALVE

The assembly is contained in a bore in the valve body above the shift valves. When the manual valve is positioned in the Drive range, throttle pressure acts on the throttle plug of the shuttle valve (Fig. 262) to move it against a spring, increasing the spring force on the shuttle valve. During a part or full throttle 1-2 upshift, the throttle plug is bottomed by throttle pressure, holding the shuttle valve to the right against governor pressure, and opening a by-pass circuit. The shuttle valve controls the quality of the kickdown shift by restricting the rate of fluid discharge from the front clutch and servo release circuits. During a 3-2 kickdown, fluid discharges through the shuttle by-pass circuit. When the shuttle valve closes the by-pass circuit, fluid discharge is restricted and controlled for the application of the front band. During a 2-3 "lift foot" upshift, the shuttle valve by-passes the restriction to allow full fluid flow through the by-pass groove for a faster release of the band.

8101049

Fig. 270 Manual Valve

VALVE BODY (Continued)

BOOST VALVE

The boost valve (Fig. 271) provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts (Fig. 272), and when accelerating in fourth gear. The boost valve also serves to increase line pressure during torque converter lock-up.

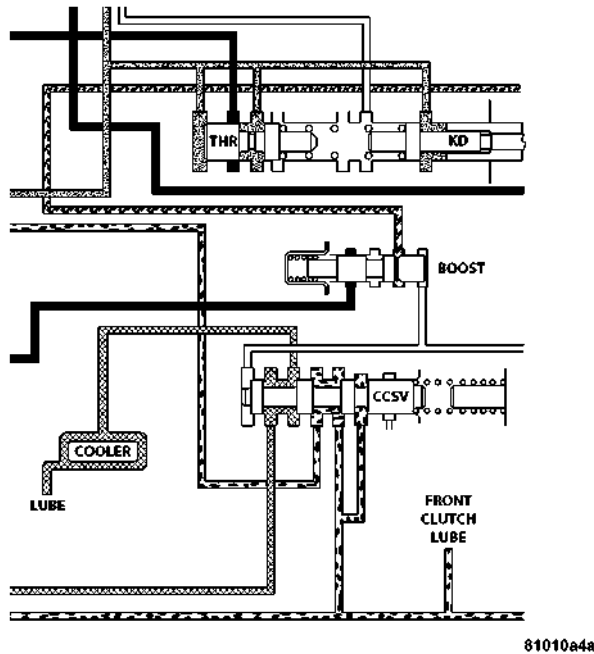

Fig. 271 Boost Valve Before Lock-up

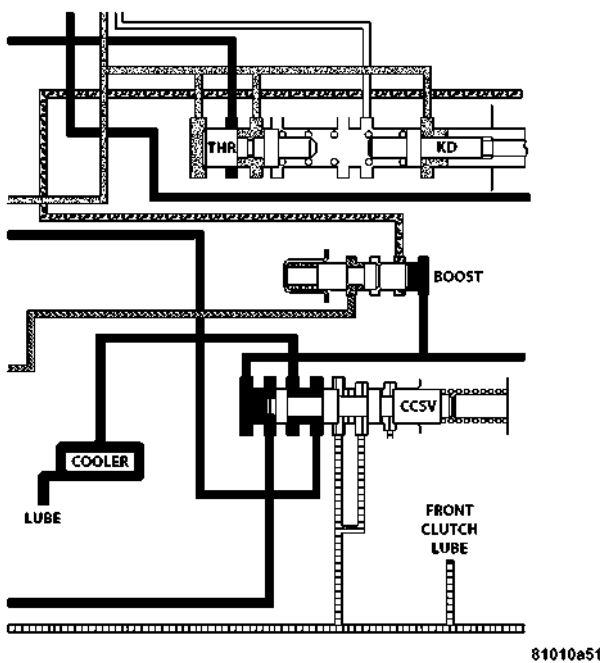

Fig. 272 Boost Valve After Lock-up

REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.
- Governor pressure sensor (includes transmission temperature thermistor).
- Converter clutch/overdrive solenoid assembly and harness.
- Governor housing gasket.
- Solenoid case connector O-rings.

- (1) Shift transmission into NEUTRAL.
- (2) Raise vehicle.
- (3) Remove gearshift and throttle levers from shaft of valve body manual lever.
- (4) Disconnect wires at solenoid case connector (Fig. 273).
- (5) Remove the transmission range sensor (Refer to 21 - TRANSMISSION/AUTOMATIC/TRANSMISSION RANGE SENSOR - REMOVAL).
- (6) Position drain pan under transmission oil pan.
- (7) Remove transmission oil pan and gasket.
- (8) Remove fluid filter from valve body.
- (9) Remove bolts attaching valve body to transmission case.
- (10) Lower valve body enough to remove accumulator piston and springs.

Fig. 273 Transmission Case Connector

- 1 - SOLENOID CASE CONNECTOR
- 2 - TRANSMISSION RANGE SENSOR

VALVE BODY (Continued)

(11) Work manual lever shaft and electrical connector out of transmission case.

(12) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 274).

DISASSEMBLY

CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.

(1) Disconnect wires from governor pressure sensor and solenoid.

(2) Remove screws attaching governor body and retainer plate to transfer plate.

(3) Remove retainer plate, governor body and gasket from transfer plate.

(4) Remove governor pressure sensor from governor body.

(5) Remove governor pressure solenoid by pulling it straight out of bore in governor body. Remove and discard solenoid O-rings if worn, cut, or torn.

(6) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 275). Retain shoulder bolt. Either tape it to harness or thread it back into accumulator housing after connector removal.

(7) Unhook overdrive/converter solenoid harness from 3-4 accumulator cover plate (Fig. 276).

VALVE BODY (Continued)

(12) Secure detent ball and spring with Retainer Tool 6583 (Fig. 281).

(13) Remove park rod E-clip and separate rod from manual lever (Fig. 282).

(14) Remove E-clip and washer that retains throttle lever shaft in manual lever (Fig. 283).

(15) Remove manual lever and throttle lever (Fig. 284). Rotate and lift manual lever off valve body and throttle lever shaft. Then slide throttle lever out of valve body.

(16) Position pencil magnet next to detent housing to catch detent ball and spring. Then carefully remove Retainer Tool 6583 and remove detent ball and spring (Fig. 285).

J9521-101

Fig. 292 Boost Valve Tube Brace

- 1 - BOOST VALVE TUBE
- 2 - TUBE BRACE (DOUBLE TAB)

(25) Remove boost valve connecting tube (Fig. 293). Disengage tube from upper housing port first. Then rock opposite end of tube back and forth to work it out of lower housing.

CAUTION: Do not use tools to loosen or pry the connecting tube out of the valve body housings. Loosen and remove the tube by hand only.

(26) Turn valve body over so lower housing is facing upward (Fig. 294). In this position, the two check balls in upper housing will remain in place and not fall out when lower housing and separator plate are removed.

(27) Remove screws attaching valve body lower housing to upper housing and transfer plate (Fig. 294). Note position of boost valve tube brace for assembly reference.

(28) Remove lower housing and overdrive separator plate from transfer plate (Fig. 294).

VALVE BODY (Continued)

VALVE BODY UPPER HOUSING

(1) Note location of check balls in valve body upper housing (Fig. 299). Then remove the one large diameter and the five smaller diameter check balls.

(2) Remove governor plug and shuttle valve covers (Fig. 301).

(3) Remove E-clip that secures shuttle valve secondary spring on valve stem (Fig. 300).

(4) Remove throttle plug, primary spring, shuttle valve, secondary spring, and spring guides (Fig. 301).

(5) Remove boost valve retainer, spring and valve if not previously removed.

(6) Remove throttle plug and 1-2 and 2-3 governor plugs (Fig. 288).

(7) Turn upper housing around and remove limit valve and shift valve covers (Fig. 302).

(8) Remove limit valve housing. Then remove retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing (Fig. 302).

(9) Remove 1-2 shift control valve and spring (Fig. 302).

(10) Remove 1-2 shift valve and spring (Fig. 302).

(11) Remove 2-3 shift valve and spring from valve body (Fig. 302).

(12) Remove pressure plug cover (Fig. 302).

(13) Remove line pressure sleeve, throttle pressure plug and spring (Fig. 302).

CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either

part has sustained physical damage (dented, deformed, broken, etc.).

CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is **NOT** serviceable. Do not try to remove the filter as this will damage the valve housing.

INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straight-edge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

VALVE BODY (Continued)

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

ASSEMBLY

CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.

LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 305).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 310). Seven check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 5 check balls are approximately 6.3 mm (1/4 in.) in diameter.

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 311). Be sure filter screen is seated in proper housing recess.

VALVE BODY (Continued)

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 314).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N-m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 314).

UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 315), (Fig. 316) and (Fig. 317) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N-m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

VALVE BODY (Continued)

- (5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.
- (6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).
- (7) Install shuttle valve as follows:
 - (a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.
 - (b) Install shuttle valve into housing.
 - (c) Hold shuttle valve in place.
 - (d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

- (e) Verify that spring and E-clip are properly seated before proceeding.
- (8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.
- (9) Install 1-2 and 2-3 valve governor plugs in valve body.
- (10) Install shuttle valve primary spring and throttle plug.
- (11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 318).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 318).

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 319).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 319).

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 320).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

VALVE BODY (Continued)

3-4 ACCUMULATOR

- (1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 321).
- (2) Loosely attach accumulator housing with right-side screw (Fig. 321). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.
- (3) Install 3-4 shift valve and spring.
- (4) Install converter clutch timing valve and spring.
- (5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.
- (6) Swing accumulator housing upward over valve springs and plug.
- (7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 322). Tighten screws to 4 N·m (35 in. lbs.).

- 4 - CONVERTER CLUTCH VALVE SPRING

VALVE BODY FINAL

- (1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.
- (2) Insert manual lever detent spring in upper housing.
- (3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 323).

J9521-178

Fig. 323 Detent Ball Spring

- 1 - SPECIAL TOOL 6583 POSITIONED ON DETENT HOUSING

- (4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.
- (5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.
- (6) Then install manual lever seal, washer and E-clip.

VALVE BODY (Continued)

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 324).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

(11) Install manual valve.

(12) Install throttle valve and spring.

(13) Install kickdown valve and detent.

(14) Install pressure regulator valve.

(15) Install switch valve.

(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.

(17) Perform Line Pressure and Throttle Pressure adjustments. (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC/VALVE BODY - ADJUSTMENTS)

(18) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.

(19) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 325). Seat tang in dimple before tightening connector screw.

(20) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.

Fig. 324 Manual And Throttle Lever Alignment

- 1 - THROTTLE LEVER
- 2 - MANUAL LEVER VALVE ARM
- 3 - MANUAL VALVE
- 4 - KICKDOWN VALVE

(21) Verify that solenoid wire harness is properly routed (Fig. 326). Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.

Fig. 325 Solenoid Harness Case Connector Shoulder Bolt

- 1 - SOLENOID HARNESS CASE CONNECTOR

VALVE BODY (Continued)

GOVERNOR BODY, SENSOR AND SOLENOID

- (1) Turn valve body assembly over so accumulator side of transfer plate is facing down.
- (2) Install new O-rings on governor pressure solenoid and sensor.
- (3) Lubricate solenoid and sensor O-rings with clean transmission fluid.
- (4) Install governor pressure sensor in governor body.
- (5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.
- (6) Position governor body gasket on transfer plate.
- (7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.
- (8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.
- (9) Connect harness wires to governor pressure solenoid and governor pressure sensor.
- (10) Install fluid filter and pan.
- (11) Lower vehicle.
- (12) Fill transmission with recommended fluid and road test vehicle to verify repair.

INSTALLATION

- (1) Check condition of O-ring seals on valve body harness connector (Fig. 327). Replace seals on connector body if cut or worn.
- (2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 328).
- (3) Check condition of seals on accumulator piston. Install new piston seals, if necessary.
- (4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.
- (5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.
- (6) Lubricate seal rings on valve body harness connector with petroleum jelly.
- (7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.

- (8) Install accumulator spring and piston into case. Then swing valve body over piston and outer spring to hold it in place.
- (9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.
- (10) Then seat valve body in case and install one or two bolts to hold valve body in place.
- (11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.
- (12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.
- (13) Install throttle and gearshift levers on valve body manual lever shaft.
- (14) Check and adjust front and rear bands if necessary.
- (15) Install the transmission range sensor (Refer to 21 - TRANSMISSION/AUTOMATIC/TRANSMISSION RANGE SENSOR - INSTALLATION).
- (16) Connect solenoid case connector wires.
- (17) Install oil pan and new gasket. Tighten pan bolts to 13.6 N·m (125 in. lbs.) torque.
- (18) Lower vehicle and fill transmission with Mopar® ATF +4, Automatic Transmission fluid.
- (19) Check and adjust gearshift and throttle valve cables, if necessary.

Fig. 329 Line Pressure Adjustment

- 1 - WRENCH
- 2 - 1-5/16 INCH

ADJUSTMENTS - VALVE BODY

CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 329).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 330).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.

J9521-109

AUTOMATIC TRANSMISSION - 45RFE/545RFE

DESCRIPTION

The 45RFE/545RFE automatic transmissions is a sophisticated, multi-range, electronically controlled transmission which combines optimized gear ratios for responsive performance, state of the art efficiency features and low NVH. Other features include driver adaptive shifting and three planetary gear sets to provide wide ratio capability with precise ratio steps for optimum driveability. The three planetary gear sets also make available a unique alternate second gear ratio. The primary 2nd gear ratio fits between 1st and 3rd gears for normal through-gear accelerations. The alternate second gear ratio (2prime) allows smoother 4-2 kickdowns at high speeds to provide 2nd gear passing performance over a wider highway cruising range.

The hydraulic portion of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components.

The primary mechanical components of the transmission consist of the following:

- Three multiple disc input clutches
- Three multiple disc holding clutches
- Five hydraulic accumulators
- Three planetary gear sets
- Dual Stage Hydraulic oil pump
- Valve body
- Solenoid pack

The TCM is the “heart” or “brain” of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

TRANSMISSION IDENTIFICATION

Transmission identification numbers are stamped on the left side of the case just above the oil pan sealing surface (Fig. 1). Refer to this information when ordering replacement parts. A label is attached to the transmission case above the stamped numbers. The label gives additional information which may also be necessary for identification purposes.

80a13150

Fig. 1 Transmission Part And Serial Number Location

1 - IDENTIFICATION NUMBERS (STAMPED)

GEAR RATIOS

The 45RFE gear ratios are:

1st	3.00:1
2nd	1.67:1
2nd Prime	1.50:1
3rd	1.00:1
4th	0.75:1
Reverse	3.00:1

GEAR RATIOS

The 545RFE gear ratios are:

1st	3.00:1
2nd	1.67:1
2nd Prime	1.50:1
3rd	1.00:1
4th	0.75:1
5th	0.67:1
Reverse	3.00:1

OPERATION

The 45RFE/545RFE offers full electronic control of all automatic up and downshifts, and features real-time adaptive closed-loop shift and pressure control. Electronic shift and torque converter clutch controls help protect the transmission from damage due to high temperatures, which can occur under severe operating conditions. By altering shift schedules, line pressure, and converter clutch control, these controls reduce heat generation and increase transmission cooling.

To help reduce efficiency-robbing parasitic losses, the transmissions includes a dual-stage transmission fluid pump with electronic output pressure control. Under most driving conditions, pump output pressure greatly exceeds that which is needed to keep the clutches applied. The 45RFE/545RFE pump-pressure control system monitors input torque and adjusts the pump pressure accordingly. The primary stage of the pump works continuously; the second stage is bypassed when demand is low. The control system also monitors input and output speed and, if incipient clutch slip is observed, the pressure control solenoid duty cycle is varied, increasing pressure in proportion to demand.

A high-travel torque converter damper assembly allows earlier torque converter clutch engagement to reduce slippage. Needle-type thrust bearings reduce internal friction. The 45RFE/545RFE is packaged in a one-piece die-cast aluminum case. To reduce NVH, the case has high lateral, vertical and torsional stiffness. It is also designed to maximize the benefit of the structural dust cover that connects the bottom of the bell housing to the engine bedplate, enhancing overall power train stiffness. Dual filters protect the pump and other components. A pump return filter is added to the customary main sump filter. Independent lubrication and cooler circuits assure ample pressure for normal transmission operation even if the cooler is obstructed or the fluid cannot flow due to extremely low temperatures.

The hydraulic control system design (without electronic assist) provides the transmission with PARK, REVERSE, NEUTRAL, SECOND, and THIRD gears, based solely on driver shift lever selection. This design allows the vehicle to be driven (in "limp-in" mode) in the event of a electronic control system failure, or a situation that the Transmission Control Module (TCM) recognizes as potentially damaging to the transmission.

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the DRB® scan tool.

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

CAUTION: Before attempting any repair on a RFE automatic transmission, check for Diagnostic Trouble Codes with the DRB® scan tool.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

DIAGNOSIS AND TESTING - PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

- (1) Check for transmission fault codes using DRB® scan tool.
- (2) Check fluid level and condition.
- (3) Adjust gearshift cable if complaint was based on delayed, erratic, or harsh shifts.
- (4) Road test and note how transmission upshifts, downshifts, and engages.
- (5) Perform hydraulic pressure test if shift problems were noted during road test.

- (6) Perform air-pressure test to check clutch operation.

VEHICLE IS DISABLED

- (1) Check fluid level and condition.
- (2) Check for broken or disconnected gearshift cable.
- (3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
- (4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:
 - (a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
 - (b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.
 - (c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application charts provide a basis for analyzing road test results.

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

An accurate tachometer and pressure test gauges are required. Test Gauge C-3293-SP has a 300 psi range and is used at all locations where pressures exceed 100 psi.

Pressure Test Port Locations

Only two pressure ports are supplied on the transmission case. The torque converter clutch apply and release ports are located on the right side of the transmission case (Fig. 2).

80ba79d0

Fig. 2 Torque Converter Pressure Locations

- 1 - TCC RELEASE
- 2 - TO COOLER
- 3 - TCC APPLY
- 4 - FROM COOLER
- 5 - LINE PRESSURE SENSOR

To determine the line pressure, there are two available methods. The DRB® scan tool can be used to read line pressure from the line pressure sensor. The second method is to install Line Pressure Adapter 8259 (Fig. 4) into the transmission case and then install the pressure gauge and the original sensor into the adapter. This will allow a comparison of the DRB® readings and the gauge reading to determine the accuracy of the line pressure sensor. The DRB® line pressure reading should match the gauge reading within ±10 psi.

In order to access any other pressure tap locations, the transmission oil pan must be removed, the pressure port plugs removed and Valve Body Pressure Tap Adapter 8258-A (Fig. 5) installed. The extensions supplied with Adapter 8258-A will allow the installation of pressure gauges to the valve body. Refer to (Fig. 3) for correct pressure tap location identification.

80ba79d1

Fig. 3 Pressure Tap Locations

80c072fb

Fig. 4 Line Pressure Adapter 8259

- 1 - LINE PRESSURE SENSOR PORT
- 2 - LINE PRESSURE SENSOR
- 3 - TOOL 8259
- 4 - PRESSURE TAP

TEST PROCEDURE

All pressure readings should be taken with the transmission fluid level full, transmission oil at the normal operating temperature, and the engine at 1500 rpm. Check the transmission for proper operation in each gear position that is in question or if a specific element is in question, check the pressure readings in at least two gear positions that employ that element. Refer to the Hydraulic Schematics at the rear of this section to determine the correct pressures for each element in a given gear position.

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

80c072fa

Fig. 5 Valve Body Pressure Tap Adapter 8258-A

- 1 - 45RFE TRANSMISSION
- 2 - TOOL 8258-A

NOTE: The 45RFE/545RFE utilizes closed loop control of pump line pressure. The pressure readings may therefore vary greatly but should always follow line pressure.

Some common pressures that can be measured to evaluate pump and clutch performance are the upshift/downshift pressures, garage shift pressures, and TCC pressure. The upshift/downshift pressure for all shifts are shown in UPSHIFT PRESSURES and DOWNSHIFT PRESSURES. In-gear maximum pressure for each gear position is shown in IN-GEAR PRESSURES. The garage shift pressure when performing a N-R shift is 220 psi for 3.7L/4.7L equipped vehicles and 250 psi for 5.7L equipped vehicles. The garage shift pressure for the R-N shift is 120 psi. The garage shift pressure for the N-1 shift is 135 psi for 3.7L/4.7L equipped vehicles and 165 psi for 5.7L equipped vehicles. Torque converter lock-up pressure is 120 psi for 3.7L/4.7L equipped vehicles and 125 psi for 5.7L equipped vehicles.

UPSHIFT PRESSURES

ENGINE	1-2	2-3	2prime-3	3-4	2prime-4	2-5	3-5	4-5
5.7L	150	125	125	135	135	135	135	135
3.7L/ 4.7L	120	120	120	120	120	120	120	130

DIAGNOSIS AND TESTING - AIR CHECKING TRANSMISSION CLUTCH OPERATION

Air-pressure testing can be used to check transmission clutch operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The clutch apply passages are shown (Fig. 6).

80b9a594

Fig. 6 Air Pressure Test Passages

- 1 - LOW REVERSE CLUTCH
- 2 - 4TH CLUTCH
- 3 - 2ND CLUTCH
- 4 - OVERDRIVE CLUTCH
- 5 - UNDERDRIVE CLUTCH
- 6 - REVERSE CLUTCH

NOTE: The air supply which is used must be free of moisture and dirt. Use a pressure of 30 psi to test clutch operation.

Apply air pressure at each port. If the clutch is functioning, a soft thump will be heard as the clutch

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

is applied. The clutch application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch should also release.

DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

- (1) Verify that a leak condition actually exists.
- (2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Torque converter seal leaks tend to move along the drive hub and onto the rear of the converter. Pump cover seal tend to run down the cover and the inside surface of the bellhousing.

Some leaks, or suspected leaks, may be particularly difficult to locate. If necessary, a Mopar® approved dye may be used to locate a leak.

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

- (1) Leaks at the weld joint around the outside diameter weld (Fig. 7).
- (2) Leaks at the converter hub weld (Fig. 7).

Fig. 7 Torque Converter Assembly

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Raise and support the vehicle
- (3) Remove any necessary skid plates. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)
- (4) Mark propeller shaft and axle companion flanges for assembly alignment.
- (5) Remove the rear propeller shaft
- (6) Remove the front propeller shaft, if necessary.
- (7) Remove the engine to transmission collar (Fig. 8).

Fig. 8 Transmission Collar

- 1 - ENGINE
- 2 - STRUCTURAL DUST COVER
- 3 - TRANSMISSION

(8) Remove the exhaust support bracket from the rear of the transmission.

(9) Disconnect and lower or remove any necessary exhaust components.

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

(10) Remove the starter motor.

(11) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

(12) Disengage the output speed sensor connector from the output speed sensor (Fig. 9).

(13) Disengage the input speed sensor connector from the input speed sensor (Fig. 10).

Fig. 9 Disconnect Output Speed Sensor

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

(16) Disconnect gearshift cable from transmission manual valve lever (Fig. 13).

Fig. 13 Gearshift Cable at Transmission - RFE

- 1 - GEARSHIFT CABLE
- 2 - RFE TRANSMISSION
- 3 - MANUAL LEVER

(17) Disconnect the transmission vent hose from the transmission.

(18) Support rear of engine with safety stand or jack.

(19) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(20) Remove bolts securing rear support and cushion to transmission and crossmember.

(21) Remove transfer case, if necessary.

(22) Disconnect transmission fluid cooler lines at transmission fittings and clips.

(23) Remove all remaining converter housing bolts.

(24) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(25) Hold torque converter in place during transmission removal.

(26) Lower transmission and remove (Fig. 14) assembly from under the vehicle.

(27) To remove torque converter, carefully slide torque converter out of the transmission.

80ccc435

Fig. 14 Remove Transmission

- 1 - ENGINE
- 2 - TRANSMISSION

DISASSEMBLY

(1) Drain fluid from transmission.

(2) Clean exterior of transmission with suitable solvent or pressure washer.

(3) Remove the torque converter from the transmission.

(4) Remove the manual shift lever from the transmission.

(5) Remove the input, output, and line pressure sensors from the transmission case (Fig. 15).

80c07350

Fig. 15 Remove Input, Output, and Line Pressure Sensors

- 1 - OUTPUT SPEED SENSOR
- 2 - LINE PRESSURE SENSOR
- 3 - INPUT SPEED SENSOR

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

(6) Inspect the ends of the sensors for debris, which may indicate the nature of the transmission failure.

(7) Install Support Stand 8257 onto the transmission case (Fig. 16).

80c-07351

Fig. 16 Install Support Stand - Tool 8257

1 - TOOL 8257

(8) Using Adapter 8266-1 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the input shaft end-play (Fig. 17).

80c-07352

Fig. 17 Measure Input Shaft End Play

1 - TOOL 8266
2 - TOOL C-3339

NOTE: When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.

(9) Remove the bolts holding the transmission extension/adapter housing to the transmission case.

(10) Remove the extension/adapter housing from the transmission case.

(11) Using Alignment Plate 8261, Adapter 8266-17 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the output shaft end-play (Fig. 18).

80c-07353

- (49) Remove the dipstick tube seal.

CLEANING

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF +4, Automatic Transmission Fluid, during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

(1) Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.

(2) Install the cooler filter bypass valve.

(3) Torque the bypass valve to specification. The valve uses a tapered pipe thread and excessive torque can damage the transmission case. Tighten the cooler filter bypass valve to 4.5 N·m (40 in.lbs.).

(4) Install a new selector shaft seal using Seal Installer 8253 (Fig. 32).

Fig. 32 Install Selector Shaft

80c07359

Fig. 35 Install 2C Clutch Pack

- 1 - SNAP-RING
- 2 - PLATE
- 3 - DISC
- 4 - REACTION PLATE

NOTE: Before final assembly of transmission centerline, the 2C/4C clutch components should be installed into position and measured as follows:

(10) Install the 2C reaction plate into the transmission case (Fig. 35).

(11) Install the 2C clutch pack into the transmission case (Fig. 35).

(12) Install the flat 2C clutch snap-ring into the transmission case (Fig. 35).

(13) Install the 4C retainer/bulkhead into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area.

(14) Install the 4C retainer/bulkhead tapered snap-ring into the transmission case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.

(15) Using a feeler gauge through the opening in the rear of the transmission case, measure the 2C clutch pack clearance between the 2C reaction plate and the transmission case at four different points. The average of these measurements is the 2C clutch pack clearance. The correct clutch clearance is 0.455-1.335 mm (0.018-0.053 in.). The reaction plate is not selective. If the clutch pack clearance is not within

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

specification, the reaction plate, all the friction discs, and steels must be replaced.

(16) Remove the 4C retainer/bulkhead and all of the 2C clutch components from the transmission case.

(17) Install the low/reverse clutch assembly (Fig. 36). Make sure that the oil feed hole points toward the valve body area and that the bleed orifice is aligned with the notch in the rear of the transmission case.

(18) Install the snap-ring to hold the low/reverse clutch retainer into the transmission case (Fig. 36). The snap-ring is tapered and must be installed with the tapered side forward. Once installed, verify that the snap-ring is fully seated in the snap-ring groove.

80c07411

Fig. 36 Install Low/Reverse Clutch Retainer

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

(31) Install the output shaft selective thrust plate onto the reaction annulus with the oil grooves facing the annulus gear and the tabs and notches aligned as shown in (Fig. 42).

80c07425

Fig. 42 Thrust Plate Alignment

- 1 - LOCATING LUG (3)
2 - THRUST PLATE

(32) Install the number 6 bearing against the output shaft selective thrust plate with the flat side against the thrust plate (Fig. 41) and the raised tabs on the inner race facing the front of the transmission.

(33) Install the reaction annulus into the reaction planetary gear set (Fig. 41).

(34) Install the 4C retainer/bulkhead into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area. Rotate the reaction annulus during the installation of the 4C retainer/bulkhead to ease installation.

(35) Install the 4C retainer/bulkhead tapered snap-ring into the transmission case (Fig. 43) with the taper toward the front of the case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.

(36) Air check the 2C and 4C clutch operation.

(37) Using Alignment Plate 8261, Adapter 8266-17 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the output shaft end-play (Fig. 44). The correct output shaft end-play is 0.22-0.55 mm (0.009-0.021 in.). Adjust as necessary. Install the chosen output shaft selective thrust plate and re-measure end-play to verify selection.

(38) Apply a bead of RTV silicone and install the extension/adaptor housing onto the transmission case.

80ce60a3

Fig. 43 Install 4C Clutch Retainer/Bulkhead

(39) Install and torque the bolts to hold the extension/adaptor housing onto the transmission case. The correct torque is 54 N·m (40 ft.lbs.).

(40) Install the number 5 bearing and selective thrust plate onto the 4C retainer/bulkhead (Fig. 45). Be sure that the outer race of the bearing is against the thrust plate.

(41) Install the input clutch assembly into the transmission case (Fig. 45). Make sure that the input clutch assembly is fully installed by performing a

AUTOMATIC TRANSMISSION - 45RFE/545RFE (Continued)

visual inspection through the input speed sensor hole. If the tone wheel teeth on the input clutch assembly are centered in the hole, the assembly is fully installed.

(42) Install the number 1 bearing with the outer race up in the pocket of the input clutch assembly (Fig. 45).

80c07357

Fig. 45 Install Input Clutch Assembly

- 1 - BEARING NUMBER 5
- 2 - THRUST PLATE (SELECT)
- 3 - INPUT CLUTCH ASSEMBLY
- 4 - BEARING NUMBER 1

(43) Install the oil pump into the transmission case (Fig. 46).

(44) Install the bolts to hold the oil pump into the transmission case. Tighten the oil pump bolts to 28 N·m (250 in.lbs.).

(45) Using Adapter 8266-1 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the input shaft end-play (Fig. 47). The correct end-play is 0.46-0.89 mm (0.018-0.035 in.). Adjust as necessary. Install the chosen thrust plate on the number 5 bearing and re-measure end-play to verify selection.

NOTE: When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.

- 2 - TRANSMISSION COVER
- 3 - OUTER SNAP-RING

(49) Using Installer 8255, install the inner transmission front cover snap-ring the remainder of the way onto the oil pump (Fig. 49).

80c07417

Fig. 49 Seat Snap-Ring Using Tool 8255

- 1 - TOOL 8255
- 2 - SNAP-RING

(50) Install the valve body (Fig. 50). Verify that the pin on the manual lever has properly engaged the TRS selector plate. Tighten the valve body to transmission case bolts to 12 N·m (105 in.lbs.).

80c07354

Fig. 50 Install Valve Body Assembly

- 1 - VALVE BODY TO CASE BOLT (6)

CAUTION: The primary oil filter seal **MUST** be fully installed flush against the oil pump body. **DO NOT** install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

(51) Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.

(52) Install the primary oil filter and the oil cooler return filter (Fig. 51). Tighten the screw to hold the primary oil filter to the valve body to 4.5 N·m (40 in.lbs.). Using Oil Filter Wrench 8321, tighten the cooler return oil filter to the transmission case to 14 N·m (125 in.lbs.).

(53) Apply RTV silicone to the oil pan and install the transmission oil pan. Tighten the bolts to 12 N·m (105 in.lbs.).

(54) Install the input, output, and line pressure sensors (Fig. 52). Tighten the bolts to 12 N·m (105 in.lbs.).

(55) Install the manual shift lever from the transmission. Torque the retaining cross-bolt to 16 N·m (140 in.lbs.).

INSTALLATION

(1) Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. Verify that the converter hub

- 1 - OUTPUT SPEED SENSOR
- 2 - LINE PRESSURE SENSOR
- 3 - INPUT SPEED SENSOR

o-ring is properly installed and is free of any debris. The hub must be smooth to avoid damaging pump seal at installation.

(2) If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.

(3) Lubricate oil pump seal lip with transmission fluid.

(4) Align converter and oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 53). Surface of converter lugs should be at least 13mm (1/2 in.) to rear of straight-edge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

Fig. 53 Checking Torque Converter Seating - Typical

- 1 - SCALE
- 2 - STRAIGHTEDGE

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.

(11) Raise transmission (Fig. 54) and align the torque converter with the drive plate and transmission converter housing with the engine block.

(12) Move transmission forward. Then raise, lower or tilt transmission to align the converter housing with engine block dowels.

(13) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.

(14) Install two bolts to attach the transmission to the engine.

(15) Install remaining torque converter housing to engine bolts. Tighten to 68 N·m (50 ft.lbs.).

(16) Install transfer case, if equipped. Tighten transfer case nuts to 35 N·m (26 ft.lbs.).

(17) Install rear support to transmission. Tighten bolts to 47 N·m (35 ft.lbs.).

(18) Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts to 47 N·m (35 ft.lbs.). Tighten the clevis bracket to rear support bolt to 68 N·m (50 ft.lbs.).

(19) Remove engine support fixture.

(20) Connect gearshift cable to transmission.

(21) Connect wires to solenoid and pressure switch assembly (Fig. 55) connector, input (Fig. 56) and output (Fig. 57) speed sensors, and line pressure sensor (Fig. 58). Be sure transmission harnesses are properly routed.

Fig. 57 Connect Output Speed Sensor

- 1 - TRANSMISSION
- 2 - OUTPUT SPEED SENSOR

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(22) Install torque converter-to-driveplate bolts. Tighten bolts to 31 N·m (270 in. lbs.).

(23) Install starter motor and cooler line bracket.

(24) Connect cooler lines to transmission.

(25) Install transmission fill tube.

(26) Install exhaust components, if necessary.

(27) Install the structural dust cover (Fig. 59) (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION) onto the transmission and the engine.

80ba79d2

Fig. 59 Transmission Collar

- 1 - ENGINE
- 2 - STRUCTURAL DUST COVER

4C RETAINER/BULKHEAD

DISASSEMBLY

- (1) Remove the 2C piston belleville spring snap-ring from the 4C retainer /bulkhead (Fig. 60).
- (2) Remove the 2C piston Belleville spring from the retainer/bulkhead (Fig. 60).
- (3) Remove the 2C piston from the retainer/bulkhead. Use 20 psi of air pressure to remove the piston if necessary.
- (4) Remove the 4C clutch snap-ring from the retainer/bulkhead (Fig. 60).

(5) Remove the 4C clutch pack from the retainer/bulkhead (Fig. 60).

(6) Using Spring Compressor 8250 and a suitable shop press, compress the 4C piston return spring and remove the snap-ring (Fig. 60).

(7) Remove the 4C piston return spring and piston from the retainer/bulkhead (Fig. 60). Use 20 psi of air pressure to remove the piston if necessary.

4C RETAINER/BULKHEAD (Continued)

ASSEMBLY

(1) Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.

(2) Install new seals on the 2C and 4C pistons (Fig. 60).

(3) Lubricate all seals with Mopar® ATF +4 prior to installation.

(4) Install the 4C piston into the 4C retainer/bulkhead (Fig. 60).

(5) Position the 4C piston return spring onto the 4C piston.

(6) Using Spring Compressor 8250 and a suitable shop press, compress the 4C piston return spring and install the snap-ring (Fig. 61).

80c07419

Fig. 61 Compress 4C Piston Return Spring Using Tool 8250

1 - PRESS
2 - TOOL 8250

(7) Assemble and install the 4C clutch pack into the retainer/bulkhead (Fig. 60) with the steel separator plate against the piston.

(8) Install the 4C reaction plate and snap-ring into the retainer/bulkhead (Fig. 60). The 4C reaction plate is non-directional.

(9) Measure the 4C clutch clearance. The correct clutch clearance is 0.77-1.39 mm (0.030-0.055 in.). The snap-ring is selectable. Install the chosen snap-ring and re-measure to verify the selection.

(10) Install the 2C piston into the retainer/bulkhead (Fig. 60).

(11) Position the 2C Belleville spring onto the 2C piston.

(12) Position the 2C Belleville spring snap-ring onto the 2C Belleville spring (Fig. 60).

(13) Using Spring Compressor 8249 and a suitable shop press (Fig. 62), compress the belleville spring until the snap-ring is engaged with the snap-ring groove in the retainer/bulkhead.

80c07418

Fig. 62 Compress 2C Belleville Spring Using Tool 8249

1 - PRESS
2 - TOOL 8249

ADAPTER HOUSING SEAL

REMOVAL

- (1) Remove the transfer case from the transmission.
- (2) Using a screw mounted on a slide hammer, remove the adapter housing seal.

INSTALLATION

- (1) Clean the adapter seal bore in the adapter housing of any residue or particles remaining from the original seal.
- (2) Install new oil seal in the adapter housing using Seal Installer C-3860-A (Fig. 63). A properly installed seal is flush to the face of the seal bore.

80c07424

Fig. 63 Adapter Housing Seal Installation

1 - TOOL C-3860-A

- (3) Install the transfer case onto the transmission.

BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM

DESCRIPTION

The Brake Transmission Shifter Interlock (BTSI) (Fig. 64), is a solenoid operated system. It consists of a solenoid permanently mounted on the gearshift cable.

OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal

80dda591

Fig. 64 Brake Transmission Interlock Mechanism

- 1 - STEERING COLUMN
- 2 - GEARSHIFT CABLE
- 3 - GEARSHIFT CABLE LOCK TAB
- 4 - BTSI SOLENOID LOCK TAB
- 5 - BTSI CONNECTOR

is depressed approximately one-half an inch. A magnetic holding device in line with the park lock cable is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK

- (1) Verify that the key can only be removed in the PARK position
- (2) When the shift lever is in PARK And the shift handle pushbutton is in the "OUT" position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
- (3) Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.
- (4) Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
- (5) Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.
- (6) Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM (Continued)

ADJUSTMENTS - BRAKE TRANSMISSION SHIFT INTERLOCK

Correct cable adjustment is important to proper interlock operation. The gearshift cable must be correctly adjusted in order to shift out of PARK.

ADJUSTMENT PROCEDURE

- (1) Remove the steering column trim as necessary for access to the brake transmission shift interlock.
- (2) Shift the transmission into the PARK position.
- (3) Pull upward on both the BTSI lock tab and the gearshift cable lock tab (Fig. 65).
- (4) Verify that the shift lever is in the PARK position.
- (5) Verify positive engagement of the transmission park lock by attempting to rotate the propeller shaft. The shaft will not rotate when the park lock is engaged.
- (6) Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**
- (7) Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.
- (8) Push the gearshift cable lock tab down until it snaps in place.

80dda591

Fig. 65 Brake Transmission Interlock Mechanism

- 1 - STEERING COLUMN
- 2 - GEARSHIFT CABLE
- 3 - GEARSHIFT CABLE LOCK TAB
- 4 - BTSI SOLENOID LOCK TAB
- 5 - BTSI CONNECTOR

- (9) Locate the BTSI alignment hole in the bottom of the BTSI mechanism between the BTSI lock tab and the BTSI connector.

- (10) Move the BTSI assembly up or down on the gearshift cable until an appropriate size drill bit can be inserted into the alignment hole and through the assembly.

- (11) Push the BTSI lock tab down until it snaps into place and remove the drill bit.

- (12) Install any steering column trim previously removed.

BTSI FUNCTION CHECK

- (1) Verify removal of ignition key allowed in PARK position only.

- (2) When the shift lever is in PARK, the ignition key cylinder should rotate freely from off to lock. When the shifter is in any other position, the ignition key should not rotate from off to lock.

- (3) Shifting out of PARK should be possible when the ignition key cylinder is in the off position.

- (4) Shifting out of PARK should not be possible while applying normal force, and ignition key cylinder is in the run or start positions, unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

- (5) Shifting out of PARK should not be possible when the ignition key cylinder is in the accessory or lock position.

- (6) Shifting between any gear and NEUTRAL, or PARK, may be done without depressing foot brake with ignition switch in run or start positions.

- (7) Engine starts must be possible with shifter lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any position other than PARK or NEUTRAL.

- (8) With shifter lever in the:

- PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.

- PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.

- NEUTRAL position - Normal position. Engine starts must be possible.

- NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

FLUID AND FILTER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

(1) Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.

(2) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(3) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P (PARK) and N (NEUTRAL) positions. Place the selector lever in P (PARK) to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82 C. or 180 F.), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level will be approx-

FLUID AND FILTER (Continued)

imately at the upper COLD hole of the dipstick at 70° F fluid temperature.

NOTE: Engine and Transmission should be at normal operating temperature before performing this procedure.

- (1) Start engine and apply parking brake.
- (2) Shift the transmission into DRIVE for approximately 2 seconds.
- (3) Shift the transmission into REVERSE for approximately 2 seconds.
- (4) Shift the transmission into PARK.
- (5) Hook up DRB® scan tool and select transmission.
- (6) Select sensors.
- (7) Read the transmission temperature value.
- (8) Compare the fluid temperature value with the chart. (Fig. 66)
- (9) Adjust transmission fluid level shown on the dipstick according to the chart.

NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.

- (10) Check transmission for leaks.

STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Place a large diameter shallow drain pan beneath the transmission pan.
- (3) Remove bolts holding front and sides of pan to transmission.
- (4) Loosen bolts holding rear of pan to transmission.
- (5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.
- (6) Hold up pan and remove remaining bolts holding pan to transmission.
- (7) While holding pan level, lower pan away from transmission.
- (8) Pour remaining fluid in pan into drain pan.
- (9) Remove screw holding filter to valve body (Fig. 67).
- (10) Separate filter from valve body and oil pump and pour fluid in filter into drain pan.

Fig. 66 Transmission Fluid Temperature Chart

FLUID AND FILTER (Continued)

(11) Remove and discard the oil filter seal from the bottom of the oil pump.

(12) If replacing the cooler return filter, use Oil Filter Wrench 8321 to remove the filter from the transmission.

(13) Dispose of used trans fluid and filter(s) properly.

80b9a595

Fig. 67 Transmission Filters - 4X4 Shown

- 1 - PRIMARY OIL FILTER
- 2 - COOLER RETURN FILTER
- 3 - COOLER RETURN FILTER BYPASS VALVE
- 4 - VALVE BODY

INSPECTION

Inspect bottom of pan and magnet for excessive amounts of metal. A light coating of clutch material on the bottom of the pan does not indicate a problem unless accompanied by a slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts of debris, refer to the diagnosis section of this group.

CLEANING

(1) Using a suitable solvent, clean pan and magnet.

(2) Using a suitable gasket scraper, clean original sealing material from surface of transmission case and the transmission pan.

INSTALLATION

CAUTION: The primary oil filter seal **MUST** be fully installed flush against the oil pump body. **DO NOT** install the seal onto the filter neck and attempt to install the filter and seal as an assembly. **Damage to the transmission will result.**

(1) Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.

(2) Place replacement filter in position on valve body and into the oil pump.

(3) Install screw to hold filter to valve body (Fig. 67). Tighten screw to 4.5 N-m (40 in. lbs.) torque.

(4) Install new cooler return filter onto the transmission, if necessary. Torque the filter to 14.12 N-m (125 in.lbs.).

(5) Place bead of Mopar® RTV sealant onto the transmission case sealing surface.

(6) Place pan in position on transmission.

(7) Install bolts to hold pan to transmission. Tighten bolts to 11.8 N-m (105 in. lbs.) torque.

(8) Lower vehicle and fill transmission with Mopar® ATF +4.

STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4 to transmission:

(a) If only fluid and filter were changed, add **10 pints (5 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled and the torque converter was replaced or drained, add **24 pints (12 quarts)** of ATF +4 to transmission.

(3) Check the transmission fluid (Refer to 21 - TRANSMISSION/AUTOMATIC - RFE/FLUID - STANDARD PROCEDURE) and adjust as required.

GEARSHIFT CABLE

DIAGNOSIS AND TESTING - GEARSHIFT CABLE

(1) Engine starts must be possible with shift lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any other gear position.

(2) With the shift lever in the:

(a) PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.

(b) PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.

(c) NEUTRAL position - Normal position. Engine starts must be possible.

(d) NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

GEARSHIFT CABLE (Continued)

REMOVAL

- (1) Shift transmission into PARK.
- (2) Raise vehicle.
- (3) Disengage cable eyelet at transmission shift lever and pull cable adjuster out of mounting bracket (Fig. 68) or (Fig. 69).

Fig. 68 Gearshift Cable at Transmission - RFE

- 1 - GEARSHIFT CABLE
- 2 - RFE TRANSMISSION
- 3 - MANUAL LEVER

Fig. 69 Gearshift Cable at Transmission - RE

- 1 - GEARSHIFT CABLE
- 2 - RE TRANSMISSION
- 3 - MANUAL LEVER

- (4) Lower the vehicle.

- (5) Remove the dash panel insulation pad as necessary to access the gearshift cable grommet (Fig. 70).

- (6) Remove grommet from the dash panel.
- (7) Remove any steering column trim necessary to access the gearshift cable and BTSI mechanism.
- (8) Disconnect the BTSI wiring connector.
- (9) Disconnect cable at lower column bracket and shift lever pin and pull the cable through the dash panel opening into the vehicle (Fig. 71).

Fig. 70 Gearshift Cable at the Dash Panel

- 1 - GEARSHIFT CABLE
- 2 - GROMMET

Fig. 71 Gearshift Cable at Steering Column

- 1 - STEERING COLUMN
- 2 - GEARSHIFT CABLE
- 3 - GEARSHIFT CABLE LOCK TAB
- 4 - BTSI SOLENOID LOCK TAB
- 5 - BTSI CONNECTOR

- (10) Remove gearshift cable from vehicle.

GEARSHIFT CABLE (Continued)

INSTALLATION

(1) Route the transmission end of the gearshift cable through the opening in the dash panel (Fig. 72).

(2) Seat the cable grommet into the dash panel opening.

(3) Snap the cable into the steering column bracket so the retaining ears (Fig. 73) are engaged and snap the cable eyelet onto the shift lever ball stud.

Fig. 72 Gearshift Cable at the Dash Panel

- 1 - GEARSHIFT CABLE
- 2 - GROMMET

Fig. 73 Gearshift Cable at Steering Column

- 1 - STEERING COLUMN
- 2 - GEARSHIFT CABLE
- 3 - GEARSHIFT CABLE LOCK TAB
- 4 - BTSI SOLENOID LOCK TAB
- 5 - BTSI CONNECTOR

(4) Raise the vehicle.

(5) Place the transmission manual shift lever in the "PARK" detent (rearmost) position and rotate prop shaft to ensure transmission is in PARK.

(6) Route the gearshift cable through the transmission mounting bracket and secure the cable by snapping the cable retaining ears into the transmission bracket and snapping the cable eyelet on the manual shift lever ball stud.

(7) Lower vehicle.

(8) Lock the shift cable adjustment by pressing the cable adjuster lock tab downward until it snaps into place.

(9) Check for proper operation of the transmission range sensor.

(10) Adjust the gearshift cable (Refer to 21 - TRANSMISSION/AUTOMATIC/GEAR SHIFT CABLE - ADJUSTMENTS) and BTSI mechanism (Refer to 21 - TRANSMISSION/AUTOMATIC/BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM - ADJUSTMENTS) as necessary.

ADJUSTMENTS

GEARSHIFT CABLE

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the transmission range sensor may be faulty.

Gearshift Adjustment Procedure

(1) Shift transmission into PARK.
 (2) Release cable adjuster lock tab (underneath the steering column) (Fig. 74) to unlock cable.

(3) Raise vehicle.

(4) Disengage the cable eyelet from the transmission manual shift lever.

(5) Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.

(6) Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.

(7) Snap the cable eyelet onto the transmission manual shift lever.

GEARSHIFT CABLE (Continued)

- (8) Lower vehicle.
- (9) Lock shift cable by pressing cable adjuster lock tab downward until it snaps into place.
- (10) Check engine starting. Engine should start only in PARK and NEUTRAL

HOLDING CLUTCHES

DESCRIPTION

Three hydraulically applied multi-disc clutches are used to hold some planetary geartrain components stationary while the input clutches drive others. The 2C, 4C, and Low/Reverse clutches are considered holding clutches. The 2C and 4C clutches are located in the 4C retainer/bulkhead (Fig. 75), while the Low/Reverse clutch is located at the rear of the transmission case (Fig. 76).

OPERATION

2C CLUTCH

The 2C clutch is hydraulically applied in second and fifth gear by pressurized fluid against the 2C piston. When the 2C clutch is applied, the reverse sun gear assembly is held or grounded to the transmission case by holding the reaction planetary carrier.

4C CLUTCH

The 4C clutch is hydraulically applied in second prime and fourth gear by pressurized fluid against the 4C clutch piston. When the 4C clutch is applied, the reaction annulus gear is held or grounded to the transmission case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gear, only at low speeds, by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the input annulus assembly is held or grounded to the transmission case.

INPUT CLUTCH ASSEMBLY

- Overdrive hub
- Underdrive hub

DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly (Fig. 77) and (Fig. 78). The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, second prime, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the input sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct), fourth, and fifth gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the reverse carrier/input annulus assembly.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the reaction annulus gear is driven.

DISASSEMBLY

- (1) Remove the reverse reaction plate selective snap-ring from the input clutch retainer (Fig. 79).
- (2) Remove the reverse reaction plate from the input clutch retainer.
- (3) Remove the reverse hub and reverse clutch pack from the input clutch retainer.
- (4) Remove the number 4 bearing from the overdrive hub.
- (5) Remove the overdrive hub from the input clutch retainer (Fig. 79).

INPUT CLUTCH ASSEMBLY (Continued)

(6) Remove the number 3 bearing from the underdrive hub.

(7) Remove the OD/reverse reaction plate snap-ring from the input clutch retainer.

(8) Remove the underdrive hub, overdrive clutch, and overdrive reaction plate from the input clutch retainer (Fig. 79).

NOTE: The overdrive friction discs and steel discs are thicker than the matching components in the underdrive and reverse clutches.

(9) Remove the number 2 bearing from the input clutch hub.

(10) Remove the overdrive clutch wave snap-ring from the input clutch retainer.

(11) Remove the UD/OD reaction plate tapered snap-ring from the input clutch retainer.

(12) Remove the UD/OD reaction plate from the input clutch retainer.

(13) Remove the UD/OD reaction plate flat snap-ring from the input clutch retainer (Fig. 79).

(14) Remove the underdrive clutch pack from the input clutch retainer (Fig. 81).

- 2 - TOOL 8251
- 3 - BALANCE PISTON

(16) Remove the UD/OD balance piston and piston return spring from the input clutch retainer (Fig. 81).

(17) Remove the underdrive piston from the input clutch retainer (Fig. 81).

NOTE: Both the UD/OD balance piston and the underdrive piston have seals molded onto them. If the seal is damaged, do not attempt to install a new seal onto the piston. The piston/seal must be replaced as an assembly.

(18) Remove the input clutch retainer tapered snap-ring.

(19) Separate input clutch retainer from input clutch hub.

(20) Separate OD/reverse piston from input clutch hub retainer (Fig. 81).

(21) Remove all seals and o-rings from the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to make note of which o-ring belongs in which location.

INPUT CLUTCH ASSEMBLY (Continued)

ASSEMBLY

(1) Install all new seals and o-rings onto the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to install the correct o-ring in the correct location.

(2) Check the transmission lubrication check valve located in the input shaft using shop air. The valve should only allow air flow in one direction. If the valve allows no air flow, or air flow in both directions, the valve will need to be replaced.

(3) Lubricate all seals with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.

(4) Assemble the OD/reverse piston onto the input clutch hub (Fig. 82).

(5) Assemble the input clutch retainer onto the input clutch hub.

(6) Install the input clutch retainer tapered snap-ring with tapered side up onto the input clutch hub.

2 - TOOL 8251
3 - BALANCE PISTON

(13) Install the underdrive clutch pack into the input clutch retainer (Fig. 82).

(14) Install the UD/OD reaction plate lower flat snap-ring (Fig. 86). The correct snap-ring can be identified by the two tabbed ears.

(15) Install the UD/OD reaction plate into the input clutch retainer. The reaction plate is to be installed with the big step down.

(16) Install the UD/OD reaction plate upper tapered snap-ring with tapered side up.

(17) Install the input clutch assembly into Input Clutch Pressure Fixture 8260 (Fig. 87). Mount a dial indicator to the assembly, push down on the clutch discs and zero the indicator against the underdrive clutch discs (Fig. 88). Apply 20 psi of air pressure to the underdrive clutch and record the dial indicator reading. Measure and record UD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with UD clutch pack clearance specification. The correct clutch clearance is 0.84-1.54 mm (0.033-0.061 in.). The reaction plate is not selective. If the clutch clearance is not within specification, replace the reaction plate along with all the friction and steel discs.

(18) Install the overdrive clutch pack into the input clutch retainer (Fig. 86). The overdrive steel

separator plates can be identified by the lack of the half-moon cuts in the locating tabs.

(19) Install the overdrive clutch wavy snap-ring with the two tabbed ears into the input clutch retainer.

(20) Install the OD/reverse reaction plate into the input clutch retainer. The reaction plate is non-directional (Fig. 86).

(21) Install the OD/reverse reaction plate flat snap-ring into the input clutch retainer.

(22) Mount a dial indicator to the assembly and zero the indicator against the OD/reverse reaction

plate (Fig. 89). Apply 20 psi of air pressure to the overdrive clutch and record the dial indicator reading. Measure and record OD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with OD clutch pack clearance specification. Verify that the clutch clearance is 1.103-1.856 mm (0.043-0.073 in.). The reaction plate is not selective. If the clutch clearance is not within specification, replace the reaction plate along with all the friction and steel discs.

(23) Install the reverse clutch pack into the input clutch retainer (Fig. 86).

(27) Remove the reverse clutch pack from the input clutch retainer.

INPUT CLUTCH ASSEMBLY (Continued)

(28) Install the number 2 bearing onto the underdrive hub with outer race against the hub with petroleum jelly.

(29) Install the underdrive hub into the input clutch retainer.

(30) Install the number 3 bearing into the overdrive hub with the outer race against the hub with petroleum jelly.

(31) Install the overdrive hub into the input clutch retainer.

(32) Install the number 4 bearing into the reverse hub with outer race against the hub with petroleum jelly.

(33) Install the reverse hub into the input clutch retainer.

(34) Install the complete reverse clutch pack.

(35) Install the reverse reaction plate and snapping.

(36) Push up on reaction plate to allow reverse clutch to move freely.

INPUT SPEED SENSOR

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

- (1) Raise vehicle.
- (2) Place a suitable fluid catch pan under the transmission.

(3) Remove the wiring connector from the input speed sensor (Fig. 91).

(4) Remove the bolt holding the input speed sensor to the transmission case.

(5) Remove the input speed sensor from the transmission case.

80c07350

Fig. 91 Input Speed Sensor

- 1 - OUTPUT SPEED SENSOR
- 2 - LINE PRESSURE SENSOR
- 3 - INPUT SPEED SENSOR

INSTALLATION

(1) Install the input speed sensor into the transmission case.

(2) Install the bolt to hold the input speed sensor into the transmission case. Tighten the bolt to 11.9 N·m (105 in.lbs.).

(3) Install the wiring connector onto the input speed sensor

(4) Verify the transmission fluid level. Add fluid as necessary.

(5) Lower vehicle.

LINE PRESSURE (LP) SENSOR

DESCRIPTION

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid, mounted on the side of the solenoid and pressure switch assembly. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the sump. The system also contains a variable pressure style sensor, the Line Pressure Sensor, which is a direct input to the TCM. The line pressure solenoid monitors the transmission line pressure and completes the

LINE PRESSURE (LP) SENSOR (Continued)

feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts and when the transmission is in the PARK and NEUTRAL positions. This is done to ensure consistent shift quality. During all other operation, the actual line pressure is compared to the desired line pressure and adjustments are made to the pressure control solenoid duty cycle.

REMOVAL

- (1) Raise vehicle.
- (2) Place a suitable fluid catch pan under the transmission.
- (3) Remove the wiring connector from the line pressure sensor (Fig. 92).
- (4) Remove the bolt holding the line pressure sensor to the transmission case.
- (5) Remove the line pressure sensor from the transmission case.

INSTALLATION

- (1) Install the line pressure sensor into the transmission case.

(9) Using Spring Compressor 8285 and a suitable shop press (Fig. 95), compress the low/reverse piston Belleville spring and remove the split retaining ring holding the Belleville spring into the low/reverse clutch retainer.

(10) Remove the low/reverse clutch Belleville spring and piston from the low/reverse clutch retainer. Use 20 psi of air pressure to remove the piston if necessary.

CLEANING

Clean the overrunning clutch assembly, clutch cam, and low-reverse clutch retainer. Dry them with compressed air after cleaning.

INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse clutch retainer if the clutch race, roller surface or inside diameter is scored, worn or damaged.

80c07420

Fig. 95 Compress Low/Reverse Belleville Spring Using Tool 8285

- 1 - PRESS
- 2 - TOOL 8285
- 3 - BELLEVILLE SPRING

ASSEMBLY

(1) Check the bleed orifice to ensure that it is not plugged or restricted.

(2) Install a new seal on the low/reverse piston. Lubricate the seal with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.

(3) Install the low/reverse piston into the low/reverse clutch retainer.

(4) Position the low/reverse piston Belleville spring on the low/reverse piston.

(5) Using Spring Compressor 8285 and a suitable shop press (Fig. 95), compress the low/reverse piston Belleville spring and install the split retaining ring to hold the Belleville spring into the low/reverse clutch retainer.

(6) Install the lower overrunning clutch snap-ring (Fig. 94).

(7) Assemble the inner and outer races of the overrunning clutch (Fig. 94).

(8) Position the overrunning clutch spacer on the overrunning clutch.

(9) Install the upper overrunning clutch snap-ring (Fig. 94).

(10) Assemble and install the low/reverse clutch pack into the low/reverse clutch retainer (Fig. 93).

(11) Install the low/reverse reaction plate into the low/reverse clutch retainer (Fig. 93). The reaction plate is directional and must be installed with the flat side down.

(12) Install the low/reverse clutch pack snap-ring (Fig. 93). The snap-ring is selectable and should be chosen to give the correct clutch pack clearance.

LOW/REVERSE CLUTCH (Continued)

(13) Measure the low/reverse clutch pack clearance and adjust as necessary. The correct clutch clearance is 1.00-1.74 mm (0.039-0.075 in.).

(14) Install the overrunning clutch into the low/reverse clutch retainer making sure that the index splines are aligned with the retainer.

(15) Install the overrunning clutch inner snapping.

OIL PUMP

DESCRIPTION

The oil pump (Fig. 96) is located at the front of the transmission inside the bell housing and behind the transmission front cover. The oil pump consists of two independent pumps (Fig. 97), a number of valves (Fig. 98), a front seal (Fig. 99), and a bolt on reaction shaft. The converter clutch switch and regulator valves, pressure regulator valve, and converter pressure limit valve are all located in the oil pump valve body.

Fig. 96 Oil Pump

- 1 - OIL PUMP TO CASE BOLT (6)
- 2 - OIL PUMP

OPERATION

As the torque converter rotates, the converter hub rotates the oil pump drive gear. As the drive gear rotates both driven gears, a vacuum is created when the gear teeth come out of mesh. This suction draws fluid through the pump inlet from the oil pan. As the gear teeth come back into mesh, pressurized fluid is forced into the pump outlet and to the oil pump valves.

At low speeds, both sides of the pump supply fluid to the transmission. As the speed of the torque con-

- 6 - TORQUE CONVERTER CLUTCH LIMIT VALVE

verter increases, the flow from both sides increases until the flow from the primary side alone is sufficient to meet system demands. At this point, the check valve located between the two pumps closes. The secondary side is shut down and the primary side supplies all the fluid to the transmission.

CONVERTER CLUTCH SWITCH VALVE

The converter clutch switch valve is used to control the hydraulic pressure supplied to the front (OFF) side of the torque converter clutch.

CONVERTER CLUTCH REGULATOR VALVE

The converter clutch regulator valve is used to control the hydraulic pressure supplied to the back (ON) side of the torque converter clutch.

TORQUE CONVERTER LIMIT VALVE

The torque converter limit valve serves to limit the available line pressure to the torque converter clutch.

STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Run the engine at **1800 rpm**, with the shift selector in neutral. Verify that the transmission fluid temperature is below 104.5° C (220° F) for this test.

OIL PUMP (Continued)

(3) If one quart of transmission fluid is collected in the container in 30 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 30 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

DISASSEMBLY

(1) Remove the bolts holding the reaction shaft support to the oil pump (Fig. 100).

(2) Remove the reaction shaft support from the oil pump (Fig. 100).

(3) Remove all bolts holding the oil pump halves together (Fig. 100).

(4) Using suitable prying tools, separate the oil pump sections by inserting the tools in the supplied areas and prying the halves apart.

NOTE: The oil pump halves are aligned to each other through the use of two dowels. Be sure to pry upward evenly to prevent damage to the oil pump components.

(5) Remove the screws holding the separator plate onto the oil pump body (Fig. 101).

(6) Remove the separator plate from the oil pump body (Fig. 101).

but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the oil pump cover. Use a penlight to view the bore interiors. Replace the oil pump if any bores are distorted or scored. Inspect all of the valve springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

ASSEMBLY

(1) Clean and inspect all components. Make sure that all passages are thoroughly cleaned and are free from dirt or debris. Make sure that all valves move freely in their proper bore. Make sure that all gear pockets and bushings are free from excessive wear and scoring. Replace the oil pump if any excessive wear or scoring is found.

(2) Coat the gears with Mopar® ATF +4 and install into their original locations.

(3) Lubricate the oil pump valves with Mopar® ATF +4 and install the valve, spring and retainer

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump reaction shaft support bushings. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth

OIL PUMP (Continued)

into the appropriate oil pump valve body bore (Fig. 102) (Fig. 103).

(4) Place the separator plate onto the oil pump body (Fig. 101).

(5) Install the screws to hold the separator plate onto the oil pump body (Fig. 101). Tighten the screws to 4.5 N·m (40 in.lbs.).

(6) Position the oil pump cover onto the locating dowels (Fig. 100).

(7) Seat the two oil pump halves together and install all bolts finger tight.

(8) Torque all bolts down slowly starting in the center and working outward. The correct torque is 4.5 N·m (40 in.lbs.).

(9) Verify that the oil pump gears rotate freely and smoothly.

(10) Position the reaction shaft support into the oil pump (Fig. 100).

(11) Install and torque the bolts to hold the reaction shaft support to the oil pump (Fig. 100). The correct torque is 12 N·m (105 in.lbs.).

80c07423

Fig. 104 Install Oil Pump Front Seal

1 - TOOL C-3860-A

OIL PUMP FRONT SEAL

REMOVAL

- (1) Remove transmission from the vehicle.
- (2) Remove the torque converter from the transmission.
- (3) Using a screw mounted in a slide hammer, remove the oil pump front seal.

INSTALLATION

- (1) Clean seal bore of the oil pump of any residue or particles from the original seal.
- (2) Install new oil seal in the oil pump housing using Seal Installer C-3860-A (Fig. 104).

OUTPUT SPEED SENSOR

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

- (1) Raise vehicle.
- (2) Place a suitable fluid catch pan under the transmission.
- (3) Remove the wiring connector from the output speed sensor (Fig. 105).
- (4) Remove the bolt holding the output speed sensor to the transmission case.
- (5) Remove the output speed sensor from the transmission case.

OUTPUT SPEED SENSOR (Continued)

80c07350

Fig. 105 Output Speed Sensor

- 1 - OUTPUT SPEED SENSOR
- 2 - LINE PRESSURE SENSOR
- 3 - INPUT SPEED SENSOR

INSTALLATION

- (1) Install the output speed sensor into the transmission case.
- (2) Install the bolt to hold the output speed sensor into the transmission case. Tighten the bolt to 11.9 N·m (105 in.lbs.).
- (3) Install the wiring connector onto the output speed sensor
- (4) Verify the transmission fluid level. Add fluid as necessary.
- (5) Lower vehicle.

TOW/HAUL OVERDRIVE SWITCH**DESCRIPTION**

The tow/haul overdrive OFF (control) switch is located in the shift lever arm (Fig. 106). The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once causes the tow/haul overdrive OFF mode to be entered and the Tow/Haul lamp to be illuminated. Pressing the switch a second time causes

81244870

Fig. 106 Tow/Haul Overdrive Off Switch

normal overdrive operation to be restored and the tow/haul lamp to be turned off. The tow/haul overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the tow/haul overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

REMOVAL

- (1) Using a plastic trim tool, remove the tow/haul overdrive off switch retainer from the shift lever (Fig. 107).

812448d1

Fig. 107 Tow/Haul Overdrive Off Switch Retainer

TOW/HAUL OVERDRIVE SWITCH (Continued)

(2) Pull the switch outwards to release it from the connector in the lever (Fig. 108)

812448cb

Fig. 108 Remove the Tow/Haul Overdrive Off Switch INSTALLATION

NOTE: There is enough slack in the wire to pull out the connector from the lever.

(1) Pull the connector out of the lever just enough to grasp it.

CAUTION: Be careful not to bend the pins on the tow/haul overdrive off switch. Use care when installing the switch, as it is not indexed, and can be accidentally installed incorrectly.

(2) Install the tow/haul overdrive off switch into the connector (Fig. 109)

81244ade

Fig. 109 Install the Tow/Haul Overdrive Off Switch

(3) Push the tow/haul overdrive off switch and wiring into the shift lever.

(4) Install the tow/haul overdrive off switch retainer onto the shift lever.

PISTONS

DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

PRESSURE

Pressure (Fig. 110) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

80bfe272

Fig. 110 Force and Pressure Relationship

PISTONS (Continued)

PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 111) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

Fig. 111 Pressure on a Confined Fluid

80bfe273

FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 112), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 112), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

80bfe274

Fig. 112 Force Multiplication

PISTONS (Continued)

PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 113) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

PLANETARY GEARTRAIN

DESCRIPTION

The planetary geartrain is located behind the 4C retainer/bulkhead, toward the rear of the transmission. The planetary geartrain consists of three primary assemblies:

- Reaction (Fig. 114).
- Reverse (Fig. 115).
- Input (Fig. 115).

- 2 - BEARING NUMBER 10
- 3 - BEARING NUMBER 11
- 4 - INPUT ANNULUS

- 5 - INPUT PLANETARY CARRIER
- 6 - INPUT SUN GEAR
- 7 - REVERSE PLANETARY CARRIER

OPERATION**REACTION PLANETARY GEARTRAIN**

The reaction planetary carrier and reverse sun gear of the reaction planetary geartrain are a single component which is held by the 2C clutch when required. The reaction annulus gear is a stand alone component that can be driven by the reverse clutch or held by the 4C clutch. The reaction sun gear is driven by the overdrive clutch.

REVERSE PLANETARY GEARTRAIN

The reverse planetary geartrain is the middle of the three planetary sets. The reverse planetary carrier can be driven by the overdrive clutch as required. The reverse planetary carrier is also splined to the input annulus gear, which can be held by the low/reverse clutch. The reverse planetary annulus, input planetary carrier, and output shaft are all one piece.

INPUT PLANETARY GEARTRAIN

The input sun gear of the input planetary geartrain is driven by the underdrive clutch.

DISASSEMBLY

- (1) Remove the snap-ring holding the input annulus into the input carrier (Fig. 116).
- (2) Remove the input annulus from the input carrier (Fig. 116).
- (3) Remove the number 9 bearing from the reverse planetary carrier. Note that this planetary carrier has four pinion gears.
- (4) Remove the reverse planetary gear carrier (Fig. 116).
- (5) Remove the number 10 bearing from the input sun gear (Fig. 116).
- (6) Remove the input sun gear from the input carrier (Fig. 116).
- (7) Remove the number 11 bearing from the input carrier (Fig. 116).

CLEANING

Clean the planetary components in solvent and dry them with compressed air.

PLANETARY GEARTRAIN (Continued)

80c07034

Fig. 116 Reverse/Input Planetary Carrier Assembly

- 1 - SNAP-RING
- 2 - BEARING NUMBER 10
- 3 - BEARING NUMBER 11
- 4 - INPUT ANNULUS

- 5 - INPUT PLANETARY CARRIER
- 6 - INPUT SUN GEAR
- 7 - REVERSE PLANETARY CARRIER

INSPECTION

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location.

ASSEMBLY

(1) Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.

(2) Install the number 11 bearing into the input planetary carrier so that the inner race will be toward the front of the transmission (Fig. 116).

(3) Install the input sun gear into the input carrier (Fig. 116).

(4) Install the number 10 bearing onto the rear of the reverse planetary carrier with the inner race toward the carrier (Fig. 116).

(5) Install the number 9 bearing onto the front of the reverse planetary carrier with the outer race toward the carrier and the inner race facing upward (Fig. 116).

(6) Install the reverse planetary gear carrier into the input carrier (Fig. 116).

(7) Install the input annulus gear into the input carrier (Fig. 116).

(8) Install the snap-ring to hold the input annulus gear into the input carrier (Fig. 116).

SHIFT MECHANISM

DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)
- Manual second (2)
- Manual low (1)

OPERATION

MANUAL LOW (1) range provides first gear only. Overrun braking is also provided in this range. MANUAL SECOND (2) range provides first and second gear only.

DRIVE range provides FIRST, SECOND, THIRD, OVERDRIVE FOURTH, and OVERDRIVE FIFTH (if applicable) gear ranges. The shift into OVERDRIVE FOURTH and FIFTH (if applicable) gear ranges occurs only after the transmission has completed the shift into D THIRD gear range. No further movement of the shift mechanism is required to complete the 3-4 or 4-5 (if applicable) shifts.

The FOURTH and FIFTH (if applicable) gear upshifts occur automatically when the overdrive selector switch is in the ON position. No upshift to FOURTH or FIFTH (if applicable) gears will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to THIRD is not yet complete.
- Vehicle speed is too low for the 3-4 or 4-5 (if applicable) shifts to occur.

Upshifts into FOURTH or FIFTH (if applicable) will be delayed when the transmission fluid temperature is below 4.5° C (40° F) or above 115.5° C (240° F).

SOLENOID SWITCH VALVE

DESCRIPTION

The Solenoid Switch Valve (SSV) is located in the valve body and controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

OPERATION

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In 2nd, 3rd, 4th, and 5th (if applicable) gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

SOLENOIDS

DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

1. Increase the amount of current applied to the coil or
2. Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

SOLENOIDS (Continued)

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 117) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an

overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump and contains an o-ring seal to better control oil flow.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

TORQUE CONVERTER (Continued)

IMPELLER

The impeller (Fig. 118) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

The turbine (Fig. 119) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

TORQUE CONVERTER (Continued)

STATOR

The stator assembly (Fig. 120) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 121). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

Fig. 120 Stator Components

- 1 - CAM (OUTER RACE)
- 2 - ROLLER
- 3 - SPRING
- 4 - INNER RACE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 122) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle

TORQUE CONVERTER (Continued)

OPERATION

The converter impeller (Fig. 123) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 124). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the over-run-

ning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material to the front cover, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, fourth, and fifth (if applicable) gear ranges depending on overdrive control switch position. If the overdrive control switch is in the normal ON position, the clutch will engage after the shift to fourth gear. If the

 2 - FRONT OF ENGINE
 3 - INCREASED ANGLE AS OIL STRIKES VANES
 4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

control switch is in the OFF position, the clutch will engage after the shift to third gear.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the L/R-CC Solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

NO EMCC

Under No EMCC conditions, the L/R Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

PARTIAL EMCC

Partial EMCC operation modulates the L/R Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

FULL EMCC

During Full EMCC operation, the TCM increases the L/R Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the

desired slip range of transmission input speed relative to engine rpm.

GRADUAL-TO-NO EMCC

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the L/R Solenoid duty cycle.

REMOVAL

- (1) Remove transmission and torque converter from vehicle.
- (2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

- (3) Pull the torque converter forward until the center hub clears the oil pump seal.

- (4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper or crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free from debris. The hub must be smooth to avoid damaging the pump seal at installation.

- (1) Lubricate oil pump seal lip with transmission fluid.

- (2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or converter hub o-ring while inserting torque converter into the front of the transmission.

- (3) Align torque converter to oil pump seal opening.

- (4) Insert torque converter hub into oil pump.

- (5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

- (6) Check converter seating with a scale and straightedge (Fig. 125). Surface of converter lugs should be at least 13 mm (1/2 in.) to rear of straightedge when converter is fully seated.

- (7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

- (8) Install the transmission in the vehicle.

TORQUE CONVERTER (Continued)

(9) Fill the transmission with the recommended fluid.

TRANSMISSION CONTROL RELAY

DESCRIPTION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode.

OPERATION

When the relay is "off", no power is supplied to the solenoid pack and the transmission is in "limp-in" mode. After a controller reset, the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

TRANSMISSION RANGE SENSOR

DESCRIPTION

The Transmission Range Sensor (TRS) is part of the solenoid module, which is mounted to the top of the valve body inside the transmission.

The Transmission Range Sensor (TRS) has five switch contact pins that:

- Determine shift lever position
- Supply ground to the Starter Relay in Park and Neutral only.
- Supply +12 V to the backup lamps in Reverse only.

The TRS also has an integrated temperature sensor (thermistor) that communicates transmission temperature to the TCM and PCM.

OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

There are many possible combinations of open and closed switches (codes). Seven of these possible codes are related to gear position and five are recognized as "between gear" codes. This results in many codes which should **never occur**. These are called "invalid" codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

TRANSMISSION SOLENOID/ TRS ASSEMBLY

DESCRIPTION

The transmission solenoid/TRS assembly is internal to the transmission and mounted on the valve body assembly (Fig. 126). The assembly consists of six solenoids that control hydraulic pressure to the six friction elements (transmission clutches), and the torque converter clutch. The pressure control solenoid is located on the side of the solenoid/TRS assembly. The solenoid/TRS assembly also contains five pressure switches that feed information to the TCM.

OPERATION

SOLENOIDS

Solenoids are used to control the L/R, 2C, 4C, OD, and UD friction elements. The reverse clutch is controlled by line pressure and the position of the manual valve in the valve body. All the solenoids are contained within the Solenoid and Pressure Switch Assembly. The solenoid and pressure switch assembly contains one additional solenoid, Multi-Select (MS), which serves primarily to provide 2nd and 3rd gear limp-in operation.

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid as necessary. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The MS and UD solenoids are normally applied to allow transmission limp-in in the event of an electrical failure.

Fig. 126 Transmission Solenoid/TRS Assembly

- 1 - PRESSURE CONTROL SOLENOID
- 2 - TRANSMISSION RANGE SELECTOR PLATE
- 3 - 23-WAY CONNECTOR
- 4 - SOLENOID PACK
- 5 - TRANSMISSION RANGE SENSOR
- 6 - VALVE BODY

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

TRANSMISSION SOLENOID/TRS ASSEMBLY (Continued)

PRESSURE SWITCHES

The TCM relies on five pressure switches to monitor fluid pressure in the L/R, 2C, 4C, UD, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The switches close at 23 psi and open at 11 psi, and simply indicate whether or not pressure exists. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following charts 45RFE PRESSURE SWITCH STATES and 545RFE PRESSURE SWITCH STATES :

45RFE PRESSURE SWITCH STATES

GEAR	L/R	2C	4C	UD	OD

2ND PRIME	OP	OP	CL	CL	OP
D	OP	OP	OP	CL	CL
FOURTH	OP	OP	CL	OP	CL

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is open in Manual 1.

545RFE PRESSURE SWITCH STATES

GEAR	L/R	2C	4C	UD	OD
R	OP	OP	OP	OP	OP
P/N	CL	OP	OP	OP	OP
1ST	CL*	OP	OP	CL	OP
2ND	OP	CL	OP	CL	OP
2ND PRIME	OP	OP	CL	CL	OP
D	OP	OP	OP	CL	CL
4TH	OP	OP	CL	OP	CL
5TH	OP	CL	OP	OP	CL

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is open in Manual 1.

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

REMOVAL

(1) Remove the valve body from the transmission (Fig. 127).

Fig. 127 Valve Body Bolts

1 - VALVE BODY TO CASE BOLT (6)

(2) Remove the screws holding the transmission solenoid/TRS assembly onto the valve body (Fig. 128).

(3) Separate the transmission solenoid/TRS assembly from the valve body.

Fig. 128 Transmission Solenoid/TRS Assembly Screws

1 - SOLENOID PACK BOLTS (15)

TRANSMISSION SOLENOID/TRS ASSEMBLY (Continued)

INSTALLATION

- (1) Place TRS selector plate in the PARK position.
- (2) Position the transmission solenoid/TRS assembly onto the valve body. Be sure that both alignment dowels are fully seated in the valve body and that the TRS switch contacts are properly positioned in the selector plate
- (3) Install the screws to hold the transmission solenoid/TRS assembly onto the valve body.
- (4) Tighten the solenoid assembly screws adjacent to the arrows cast into the bottom of the valve body first. Tighten the screws to 5.7 N·m (50 in.lbs.).
- (5) Tighten the remainder of the solenoid assembly screws to 5.7 N·m (50 in.lbs.).
- (6) Install the valve body into the transmission.

TRANSMISSION TEMPERATURE SENSOR

DESCRIPTION

The transmission temperature sensor is a thermistor that is integral to the Transmission Range Sensor (TRS).

OPERATION

The transmission temperature sensor is used by the TCM to sense the temperature of the fluid in the sump. Since fluid temperature can affect transmission shift quality and convertor lock up, the TCM requires this information to determine which shift schedule to operate in.

Calculated Temperature

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

VALVE BODY**DESCRIPTION**

The valve body consists of a cast aluminum valve body, a separator plate, and a transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 129) and (Fig. 130):

- Solenoid switch valve
- Manual valve
- Low/reverse switch valve
- 5 Accumulators
- 7 check balls

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

SOLENOID SWITCH VALVE

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

MANUAL VALVE

The manual valve is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the top of the valve body. The valve is connected mechanically by a cable to the gearshift mechanism. The valve is held in each of its positions by a roller detent spring (Fig. 131) that engages the "roostercomb" of the TRS selector plate.

VALVE BODY (Continued)

LOW/REVERSE SWITCH VALVE

The low/reverse switch valve allows the low/reverse clutch to be operated by either the LR/CC solenoid or the MS solenoid.

REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components. (Refer to 21 - TRANSMISSION/AUTOMATIC - 45RFE/ VALVE BODY - DISASSEMBLY)

- (1) Shift transmission into PARK.
- (2) Raise vehicle.
- (3) Disconnect wires at the solenoid and pressure switch assembly connector.
- (4) Position drain pan under transmission oil pan.
- (5) Remove transmission oil pan.
- (6) Remove the primary oil filter from valve body. (Fig. 132)

Fig. 132 Remove Primary Oil Filter

- 1 - PRIMARY OIL FILTER
- 2 - COOLER RETURN FILTER
- 3 - COOLER RETURN FILTER BYPASS VALVE
- 4 - VALVE BODY

(7) Remove bolts attaching valve body to transmission case (Fig. 133).

(8) Lower the valve body and work the electrical connector out of transmission case.

(9) Separate the valve body from the transmission.

Fig. 133 Valve Body Bolts

- 1 - VALVE BODY TO CASE BOLT (6)

DISASSEMBLY

(1) Remove the screws holding the solenoid and pressure switch assembly to the valve body (Fig. 134). Do not remove the screws on the top of the solenoid and pressure switch assembly.

(2) Separate the solenoid and pressure switch assembly from the valve body.

Fig. 134 Solenoid and Pressure Switch Assembly Screws

- 1 - SOLENOID PACK BOLTS (15)

VALVE BODY (Continued)

- (3) Remove the screw holding the detent spring (Fig. 135) onto the valve body.
- (4) Remove the detent spring from the valve body.
- (5) Remove the TRS selector plate from the valve body and the manual valve.
- (6) Remove the clutch passage seals from the valve body, if necessary.
- (7) Remove the screws holding the accumulator cover onto the valve body (Fig. 136).
- (8) Remove the accumulator springs and pistons from the valve body. Note which accumulator piston and spring belong in each location.
- (9) Place the valve body on the bench with the transfer plate upward.

NOTE: The valve body contains seven check balls. The transfer plate must be placed upward to prevent losing the check balls when the transfer plate is removed from the valve body.

- (10) Remove the screws holding the valve body to the valve body transfer plate.

- (13) Remove the retainers securing the solenoid switch valve, manual valve, and the low/reverse switch valve into the valve body and remove the associated valve and spring. Tag each valve and spring combination with location information to aid in assembly. (Fig. 138)

CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution. (Fig. 139)

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

INSPECTION

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straight-edge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

Inspect the valves and plugs (Fig. 140) for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

Inspect all the accumulator bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the accumulator springs. The springs must be free of distortion, warpage or broken coils.

VALVE BODY (Continued)

Inspect all the fluid seals on the valve body (Fig. 141). Replace any seals that are cracked, distorted, or damaged in any way. These seals pass fluid pressure directly to the clutches. Any pressure leak at these points, may cause transmission performance problems.

80b9a591

Fig. 141 Valve Body Seals

- 1 - UNDERDRIVE ACCUMULATOR (2 SPRINGS)

- 5 - LOW/REVERSE PASSAGE SEAL
- 6 - 2ND CLUTCH PASSAGE SEAL
- 7 - 4TH CLUTCH PASSAGE SEAL
- 8 - OVERDRIVE ACCUMULATOR (1 SPRING)

ASSEMBLY

(1) Lubricate valves, springs, and the housing valve bores with clean transmission fluid.

(2) Install solenoid switch valve, manual valve, and the low/reverse switch valve into the valve body.

(3) Install the retainers to hold each valve into the valve body.

(4) Install the valve body check balls into their proper locations.

(5) Position the transfer plate onto the valve body.

(6) Install the screws to hold the transfer plate to the valve body. Tighten the screws to 5.6 N·m (50 in. lbs.).

(7) Install the accumulator pistons and springs into the valve body in the location from which they were removed. Note that all accumulators except the overdrive have two springs. The overdrive accumulator piston has only one spring.

(8) Position the accumulator cover onto the valve body.

(9) Install the screws to hold the accumulator cover onto the valve body. Tighten the screws to 8 N·m (70 in. lbs.).

(10) Install the TRS selector plate onto the valve body and the manual valve.

(11) Install the solenoid and pressure switch assembly onto the valve body.

(12) Install the screws to hold the solenoid and pressure switch assembly onto the valve body. Tighten the screws to 5.7 N·m (50 in. lbs.). Tighten the screws adjacent to the arrows cast into the bottom of the transfer plate first.

(13) Position the detent spring onto the valve body.

(14) Install the screw to hold the detent spring onto the valve body. Tighten the screw to 4.5 N·m (40 in. lbs.).

(15) Install new clutch passage seals onto the valve body, if necessary

INSTALLATION

(1) Check condition of seals on valve body and the solenoid and pressure switch assembly. Replace seals if cut or worn.

(2) Place TRS selector plate in the PARK position.

(3) Place the transmission in the PARK position.

(4) Lubricate seal on the solenoid and pressure switch assembly connector with petroleum jelly.

(5) Position valve body in transmission and align the manual lever on the valve body to the pin on the transmission manual shift lever.

(6) Seat valve body in case and install one or two bolts to hold valve body in place.

(7) Tighten valve body bolts alternately and evenly to 12 N·m (105 in. lbs.) torque.

(8) Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.

CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

(9) Place replacement filter in position on valve body and into the oil pump.

(10) Install screw to hold filter to valve body. Tighten screw to 4.5 N·m (40 in. lbs.) torque.

(11) Connect the solenoid and pressure switch assembly connector.

(12) Install oil pan. Tighten pan bolts to 12 N·m (105 in. lbs.) torque.

(13) Lower vehicle and fill transmission with Mopar® ATF +4.

(14) Check and adjust gearshift cable, if necessary.

TRANSFER CASE - NV241 GENII

DESCRIPTION

The NV241 GENII transfer case is a part-time transfer case with a low-range gear system. It provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability.

The gear cases and extension are all of aluminum (Fig. 1). Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

IDENTIFICATION

An identification tag (Fig. 2) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

OPERATION

OPERATING RANGE

- Transfer case operating ranges are:
- 2H (2-wheel drive)

80de3203

Fig. 1 Transfer Case - Front View

- 1 - TRANSFER CASE
- 2 - MANUAL LEVER
- 3 - POSITION SENSOR

- 4H (4-wheel drive)
- 4LO (4-wheel drive low range)

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling

TRANSFER CASE - NV241 GENII (Continued)

80de3209

Fig. 2 Transfer Case - Rear View

- 1 - TRANSFER CASE
- 2 - IDENTIFICATION TAG

power in off road situations. Low range reduction ratio is 2.72:1.

SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector

operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a NEUTRAL detent. Lever range positions are imprinted in the shift knob.

SHIFTING

The transfer case can be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into and out of the 4L operating range.

DIAGNOSIS AND TESTING - TRANSFER CASE - NV241 GENII

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer Case difficult to shift or will not shift into desired range.	1) Vehicle speed too great to permit shifting. 2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind. 3) Transfer case external shift linkage binding. 4) Insufficient or incorrect lubricant. 5) Internal components binding, worn, or damaged.	1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift. 2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces. 3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary. 4) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid. 5) Disassemble the transfer case and replace worn or damaged components as necessary.
Transfer Case noisy in all operating ranges.	1) Insufficient or incorrect lubricant.	1) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid.

TRANSFER CASE - NV241 GENII (Continued)

Condition	Possible Cause	Correction
Noisy in, or jumps out of, four wheel drive low range.	1) Transfer case not completely engaged in 4L position. 2) Shift linkage out of adjustment. 3) Shift linkage loose or binding. 4) Range fork damaged, inserts worn, or fork is binding on the shift rail. 5) Low range gear worn or damaged.	1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position. 2) Adjust linkage. 3) Tighten, lubricate, or repair linkage as necessary. 4) Disassemble unit and repair as necessary. 5) Disassemble unit and repair as necessary.
Lubricant leaking from output shaft seal or vent.	1) Transfer case overfilled. 2) Vent closed or restricted. 3) Output shaft seals damaged or installed incorrectly.	1) Drain lubricant to the correct level. 2) Clear or replace vent as necessary. 3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal.
Abnormal tire wear.	1) Extended operation on hard, dry surfaces in the 4H position.	1) Operate vehicle in the 2H position on hard, dry surfaces.

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)
- (3) Position drain oil container under transfer case.
- (4) Remove transfer case drain plug and drain lubricant into container.
- (5) Disconnect vent hose and transfer case position sensor connector.
- (6) Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.
- (7) Support transmission with jack stand.
- (8) Mark front and rear propeller shafts for assembly reference.

(9) Remove front and rear propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(10) Support transfer case with suitable jack. Secure transfer case to jack with safety chains.

(11) Remove nuts attaching transfer case to transmission.

(12) Move transfer case assembly rearward until free of transmission output shaft.

(13) Lower jack and move transfer case from under vehicle.

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

TRANSFER CASE - NV241 GENII (Continued)

SHIFT LEVER AND FRONT OUTPUT SHAFT SEAL

- (1) Shift transfer case into NEUTRAL.
- (2) Remove nut that retains the shift lever to sector shaft. Then remove shift lever from shaft (Fig. 3).

80de4619

Fig. 3 Remove Range Lever Nut

- 1 - RANGE LEVER

- (3) Remove the front propeller shaft seal boot retaining clamp (Fig. 4).

- (4) Remove the front propeller shaft seal boot (Fig. 5).

- (5) Remove the front output shaft seal slinger by bending (Fig. 6) the slinger ears away from the transfer case.

- (6) Using a suitable pry tool (Fig. 7), remove the slinger from the output shaft using care not to damage the shaft.

80de4617

Fig. 4 Remove Boot Clamp

- 1 - SEAL BOOT
- 2 - BOOT CLAMP

- (7) Using a screw and a slide hammer, remove the front output shaft seal.

80de4615

Fig. 5 Remove Seal Boot

- 1 - SEAL BOOT
- 2 - SEAL SLINGER

80de4613

Fig. 6 Bend Slinger Ears

- 1 - SLINGER
- 2 - BEND UPWARD

80de4611

Fig. 7 Remove Slinger From Shaft

- 1 - SLINGER
- 2 - PRY TOOL

TRANSFER CASE - NV241 GENII (Continued)

REAR EXTENSION

(1) Remove rear extension bolts (Fig. 8).

80de460f

Fig. 8 Remove Rear Extension Bolts

- 1 - EXTENSION HOUSING
- 2 - TRANSFER CASE

(2) Remove rear extension housing (Fig. 9). Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

80de460d

Fig. 9 Remove Rear Extension

- 1 - EXTENSION HOUSING
- 2 - TRANSFER CASE
- 3 - PRY SLOT

(3) Remove output bearing retaining ring with heavy duty snap-ring pliers (Fig. 10).

80de460b

Fig. 10 Remove Output Shaft Retaining Ring

- 1 - REAR OUTPUT SHAFT
- 2 - OUTPUT SHAFT BEARING
- 3 - RETAINING RING
- 4 - TRANSFER CASE

OIL PUMP AND REAR CASE

(1) Remove rear case-to-front case bolts (Fig. 11).

80de4609

Fig. 11 Remove Case Bolts

- 1 - REAR CASE
- 2 - FRONT CASE
- 3 - BOLT

TRANSFER CASE - NV241 GENII (Continued)

(2) Loosen rear case with pry tool to break sealer bead. Insert tool in slot at each end of case (Fig. 12).

Fig. 12 Loosen Case Halves

- 1 - REAR CASE
- 2 - FRONT CASE
- 3 - PRY SLOTS

(3) Unseat rear case from alignment dowels.
 (4) Remove rear case and oil pump assembly from front case (Fig. 13).

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft bearing inner race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly **MUST** be replaced.

Fig. 13 Remove Rear Case

- 1 - REAR CASE
- 2 - FRONT CASE

FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Remove shift rail cup and spring (Fig. 14).

Fig. 14 Shift Rail Cup And Spring Removal

- 1 - SHIFT RAIL
- 2 - SPRING
- 3 - CUP

(2) Remove front sprocket retaining ring (Fig. 15).

Fig. 15 Removing Front Sprocket Retaining Ring

- 1 - FRONT SPROCKET
- 2 - RETAINING RING
- 3 - FRONT OUTPUT SHAFT

TRANSFER CASE - NV241 GENII (Continued)

(3) Pull mainshaft, front sprocket and chain outward about 25.4 mm (1-inch) simultaneously (Fig. 16).

(4) Remove chain from mainshaft drive sprocket and remove front sprocket and chain as assembly.

80de4600

Fig. 16 Remove Front Sprocket and Drive Chain

- 1 - FRONT DRIVE SPROCKET
- 2 - DRIVE CHAIN
- 3 - MAINSHAFT

(2) Loosen detent plug.

(3) Remove detent plug, spring, and plunger (Fig. 18). Note that the plug has an O-ring seal. Remove and discard this seal.

80de457b

Fig. 18 Remove Detent Plug, Spring, and Plunger

- 1 - FRONT CASE
- 2 - DETENT PLUG
- 3 - DETENT SPRING
- 4 - DETENT PLUNGER

SHIFT FORKS AND MAINSHAFT

(1) Remove the transfer case position sensor (Fig. 17).

80de45fd

Fig. 17 Remove Position Sensor

- 1 - FRONT CASE
- 2 - POSITION SENSOR

(4) Remove the front output shaft snap-ring (Fig. 19).

80de45f9

Fig. 19 Remove Front Output Shaft Snap-ring

- 1 - FRONT OUTPUT SHAFT
- 2 - SNAP-RING

TRANSFER CASE - NV241 GENII (Continued)

(5) Remove front output shaft from bearing in case (Fig. 20).

Fig. 20 Remove Front Output Shaft

- 1 - FRONT CASE
- 2 - FRONT OUTPUT SHAFT

(6) Pull mainshaft assembly out of input gear, mode sleeve, and case (Fig. 21).

Fig. 21 Remove Mainshaft

- 1 - FRONT CASE
- 2 - MAINSHAFT

(7) Remove mode fork, mode sleeve, and shift rail as assembly (Fig. 22). Note which way the sleeve fits in the fork (long side of sleeve goes to front).

Fig. 22 Remove Mode Fork and Shift Rail

- 1 - MODE FORK
- 2 - SHIFT RAIL
- 3 - MODE SLEEVE

(8) Remove range fork retaining ring.
 (9) Remove range fork and hub as an assembly (Fig. 23). Note fork position for installation reference.

Fig. 23 Range Fork And Hub Removal

- 1 - RANGE HUB
- 2 - RANGE FORK

TRANSFER CASE - NV241 GENII (Continued)

- (10) Remove the shift sector support (Fig. 24).
- (11) Remove shift sector (Fig. 25).

80de53ac

Fig. 24 Remove Sector Support

- 1 - SECTOR SUPPORT
- 2 - FRONT CASE
- 3 - SECTOR SHAFT

MAINSHAFT

- (1) Remove the drive sprocket retaining ring (Fig. 26) from the output shaft.
- (2) Remove the drive sprocket thrust washer (Fig. 27) from the output shaft.

80de53a3

Fig. 26 Remove The Drive Sprocket Retaining Ring

80de5392

TRANSFER CASE - NV241 GENII (Continued)

(6) Remove the mode hub (Fig. 32) from the output shaft.

Fig. 32 Remove Mode Hub

- 1 - OUTPUT SHAFT
- 2 - MODE HUB

(3) Place front case in horizontal position. Then remove input gear and low range gear as an assembly (Fig. 34). Tap gear out of bearing with plastic mallet, if necessary.

Fig. 34 Remove Input Planetary Assembly

- 1 - FRONT CASE
- 2 - INPUT PLANETARY ASSEMBLY

INPUT AND PLANETARY GEAR

(1) Remove input gear seal with suitable screw and slide hammer.

(2) Remove input gear retaining ring (Fig. 33) with heavy duty snap-ring pliers.

Fig. 33 Remove Input Gear Retaining Ring

- 1 - INPUT GEAR
- 2 - RETAINING RING

INPUT AND PLANETARY GEAR

(1) Remove snap-ring that retains input gear in low range gear (Fig. 35).

Fig. 35 Input Gear Snap-Ring Removal

- 1 - INPUT GEAR SNAP-RING

TRANSFER CASE - NV241 GENII (Continued)

- (2) Remove retainer (Fig. 36).
- (3) Remove front tabbed thrust washer (Fig. 37).
- (4) Remove input gear (Fig. 38).
- (5) Remove rear tabbed thrust washer from low range gear (Fig. 39).

Fig. 36 Input Gear Retainer Removal

- 2 - LOW RANGE GEAR
- 3 - RETAINER

Fig. 37 Front Tabbed Thrust Washer Removal

- 1 - FRONT TABBED THRUST WASHER

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

Fig. 38 Input Gear Removal

INSPECTION

MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone, however, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

TRANSFER CASE - NV241 GENII (Continued)

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 40). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 41). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads (Fig. 42). The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are not serviceable. The fork must be replaced as an assembly if the pads are worn or damaged.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

80010948

Fig. 41 Shift Forks

- 1 - RANGE FORK
- 2 - MODE FORK AND RAIL
- 3 - MODE SPRING

REAR RETAINER COMPONENTS

Inspect the retainer components. Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore.

Inspect the retaining rings and washers. Replace any part if distorted, bent, or broken. Reuse is not recommended.

Inspect rear extension bushing. Replace if worn or scored.

8001b751

Fig. 42 Shift Fork And Wear Pad Locations

- 1 - RANGE FORK
- 2 - MODE FORK
- 3 - WEAR PADS (SERVICEABLE)
- 4 - WEAR PADS (SERVICEABLE)

DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 43)

Fig. 43 Low Range Annulus Gear

- 1 - FRONT CASE
- 2 - LOW RANGE ANNULUS GEAR

FRONT CASE AND REAR CASE

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

BEARINGS AND SEALS

(1) Remove the input shaft bearing (Fig. 44) from the front case with suitable snap-ring pliers.

(2) Transfer the retaining ring to the new bearing if necessary and install the bearing into the front case.

Fig. 44 Remove Input Gear Bearing

- 1 - INPUT GEAR BEARING
- 2 - FRONT CASE

TRANSFER CASE - NV241 GENII (Continued)

(3) Using Installer 6436 and Handle C-4171 (Fig. 45), remove front output shaft bearing.

(4) Start front output shaft bearing in case. Then seat bearing with Handle C-4171 and Installer 6953.

80de5977

Fig. 45 Remove Front Output Shaft Bearing

- 1 - FRONT CASE
- 2 - INSTALLER 6436
- 3 - HANDLE C-4171

(5) Install front output shaft bearing retaining ring.

(6) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 46).

(7) Install new pilot bearing with Remover/Installer 8684.

80a11090

Fig. 46 Remove Input Gear Cup Plug

- 1 - DRIFT
- 2 - INPUT GEAR

(8) Remove the front output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 47).

INPUT AND PLANETARY GEAR

(1) Lubricate gears and thrust washers (Fig. 52) with recommended transmission fluid.

(2) Install first thrust washer in low range gear (Fig. 52). Be sure washer tabs are properly aligned in gear notches.

(3) Install input gear in low range gear. Be sure input gear is fully seated.

(4) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(5) Install retainer on input gear and install snap-ring.

J9321-60

TRANSFER CASE - NV241 GENII (Continued)

(11) Assemble and install range fork and hub (Fig. 64). Be sure hub is properly seated in low range gear and engaged to the input gear.

(12) Align and insert range fork pin in shift sector slot.

(13) Install the range fork retaining ring.

Fig. 64 Install Range Fork And Hub Assembly

- 1 - RANGE HUB
- 2 - RANGE FORK

(14) Install mode fork and shift rail onto the mode sleeve.

(15) Install the mode fork, sleeve, and shift rail into the transfer case (Fig. 65).

Fig. 65 Install Mode Fork and Shift Rail

- 1 - MODE FORK
- 2 - SHIFT RAIL
- 3 - MODE SLEEVE

(16) Install mainshaft into the transfer case (Fig. 66). Guide mainshaft through the mode and range sleeves and into the input gear.

Fig. 66 Install Mainshaft

- 1 - FRONT CASE
- 2 - MAINSHAFT

(17) Install the transfer case position sensor (Fig. 67). Tighten the sensor to 20-34 N·m (16-25 ft. lbs.) torque.

Fig. 67 Install Position Sensor

- 1 - FRONT CASE
- 2 - POSITION SENSOR

TRANSFER CASE - NV241 GENII (Continued)

(18) Install range lever on sector shaft (Fig. 68).

(19) Install washer and nut on sector shaft to secure shift lever. Apply 1-2 drops Mopar® Lock N' Seal, or equivalent, to nut threads before installation. Then tighten nut to 27-34 N·m (20-25 ft. lbs.) torque.

80de4619

Fig. 68 Install Range Lever Nut

- 1 - RANGE LEVER

(20) Install new o-ring on detent plug (Fig. 69).

(21) Install detent plunger, spring, and plug (Fig. 70). Tighten the plug to 16-25 N·m (12-18 ft. lbs.).

J9421-372

Fig. 69 O-Ring Installation On Detent Plug

- 1 - O-RING
- 2 - DETENT PLUG

FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Install the front output shaft (Fig. 71) into the front output shaft bearing.

(2) Install the front output shaft retaining ring (Fig. 72) onto the output shaft.

(3) Install the new front output shaft seal with Installer MB991168A

(4) Insert front sprocket in drive chain.

80de45fb

TRANSFER CASE - NV241 GENII (Continued)

(5) Install drive chain around mainshaft sprocket (Fig. 73). Then position front sprocket over front shaft.

(6) Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.

Fig. 73 Install Front Sprocket and Drive Chain

- 1 - FRONT DRIVE SPROCKET
- 2 - DRIVE CHAIN
- 3 - MAINSHAFT

(7) If mainshaft and mode sleeve were unseated during chain installation, align and reseat mainshaft in input gear and hub.

(8) Install front sprocket retaining ring (Fig. 74).

Fig. 74 Front Sprocket Retaining Ring Installation

- 1 - FRONT SPROCKET
- 2 - RETAINING RING

(9) Install spring and cup on shift rail (Fig. 75).

Fig. 75 Shift Rail Spring And Cup Installation

- 1 - CUP
- 2 - SPRING

(10) Insert magnet in front case pocket (Fig. 76).

Fig. 76 Case Magnet Installation

- 1 - MAGNET
- 2 - CASE POCKET

OIL PUMP AND REAR CASE

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft inner bearing race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly **MUST** be replaced.

(1) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

TRANSFER CASE - NV241 GENII (Continued)

(2) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 77).

80de4602

Fig. 77 Install Rear Case

- 1 - REAR CASE
2 - FRONT CASE

(3) Install 4-5 rear case-to front case bolts (Fig. 78) to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail, and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

(4) Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts. Tighten bolts to 20-27 N·m (15-24 ft. lbs.).

(5) Install rear output bearing snap-ring (Fig. 79) to output shaft.

SEAL BOOT

(1) Install the front output shaft seal slinger with Installer 8840. Install the slinger onto the shaft until the tool contacts the rear of the output shaft.

(2) Install a new seal boot clamp onto the seal boot.

(3) Install the seal boot and clamp onto the slinger hub and tighten the clamp with Crimp Tool C-4975-A.

REAR EXTENSION

(1) Install new seal in rear extension housing seal with Installer D-163 and Handle C-4171..

(2) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.

(3) Align and install rear extension on retainer (Fig. 80).

Fig. 80 Install Rear Extension Bolts

- 1 - EXTENSION HOUSING
- 2 - TRANSFER CASE

(4) Apply Mopar® Silicone Sealer to threads of rear extension housing bolts. Then install and tighten bolts to 16-24 N·m (12-18 ft. lbs.) torque.

INSTALLATION

(1) Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.

(2) Install and tighten transfer case attaching nuts. Tighten nuts to 30-41 N·m (20-30 ft.lbs.).

(3) Remove jack stand from under transmission.

(4) Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(5) Connect vent hose and transfer case position sensor connector.

(6) Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.

(7) Adjust shift linkage, if necessary.

(8) Fill transfer case with recommended transmission fluid and install fill plug.

(9) Install skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

(10) Lower vehicle

(6) Using a screw and a slide hammer, remove the front output shaft seal.

INSTALLATION

(1) Install the new front output shaft seal with Installer MB991168A

(2) Install the front output shaft seal slinger with Installer 8840. Install the slinger onto the shaft until the tool contacts the rear of the output shaft.

(3) Install a new seal boot clamp onto the seal boot.

(4) Install the seal boot and clamp onto the slinger hub and tighten the clamp with Crimp Tool C-4975-A.

(5) Install front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

POSITION SENSOR

DESCRIPTION

The transfer case position sensor is an electronic device whose output can be interpreted to indicate the transfer case's current operating mode. The sensor consists of a five position, resistive multiplexed circuit which returns a specific resistance value to the Powertrain Control Module (PCM) for each transfer case operating mode. The sensor is located on the top of the transfer case, just left of the transfer case centerline and rides against the sector plate rooster-comb. The PCM supplies 5VDC (+/- 0.5V) to the sensor and monitors the return voltage to determine the sector plate, and therefore the transfer case, position.

OPERATION

During normal vehicle operation, the Powertrain Control Module (PCM) monitors the transfer case position sensor return voltage to determine the operating mode of the transfer case. Refer to the Operating Mode Versus Resistance table for the correct resistance for each position (Fig. 87).

POSITION SENSOR (Continued)

OPERATING MODE VERSUS RESISTANCE

SENSOR POSITION	OPERATING MODE	SENSOR RESISTANCE (ohms)
1	2H	1124-1243
2	4H	650-719
3	NEUTRAL	389-431
4	4L	199-221
5	NOT USED	57-64

REMOVAL

- (1) Raise and support the vehicle.
- (2) Disengage the transfer case position sensor connector from the position sensor.
- (3) Remove the position sensor from the transfer case.

INSTALLATION

- (1) Inspect the o-ring seal on the transfer case position sensor. Replace the o-ring if necessary.
- (2) Install the transfer case position sensor into the transfer case. Torque the sensor to 20-34 N·m (15-25 ft.lbs.).
- (3) Engage the transfer case position sensor connector to the position sensor.
- (4) Lower vehicle.
- (5) Verify proper sensor operation.

80cd3d70

Fig. 87 Position Sensor Linear Movement

- 1 - POSITION 1 - 10mm ±0.5mm
- 2 - POSITION 2 - 12mm ±0.5mm
- 3 - POSITION 3 - 14mm ±0.5mm

SHIFT LEVER

REMOVAL

- (1) Shift transfer case into 2H.
- (2) Raise and support the vehicle.
- (3) Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel to come out of trunnion, push trunnion out of shift lever.
- (4) Lower vehicle.
- (5) Remove transfer case shifter knob cap.
- (6) Remove nut holding shifter knob to shift lever.
- (7) Remove shifter knob.
- (8) Remove the shift boot from the shifter console.
- (9) Remove the bolts securing the shifter mechanism to the floor pan (Fig. 88).
- (10) Separate shift lever mechanism from the vehicle.

80de77d0

Fig. 88 Transfer Case Shifter

1 - SHIFTER BOOT
2 - SHIFTER KNOB
3 - SHIFTER CONSOLE

4 - SHIFTER MECHANISM
5 - ALIGNMENT PIN
6 - TRANSFER CASE

SHIFT LEVER (Continued)

INSTALLATION

(1) If the shifter mechanism does not have a adjustment locating pin installed, align the adjustment channel on the shifter assembly to the locating hole in the lower shift lever and install an appropriately sized pin to retain the position (Fig. 89).

(2) Position shift lever in vehicle.

(3) Install the bolts to hold the shifter mechanism to the floor pan.

(4) Raise vehicle.

(5) Verify that the transfer case is still in the 2H position. The 2H detent position on the transfer case shift arm is the second position from full forward.

(6) Install trunnion to shift lever, if necessary.

(7) Install shift rod to trunnion, if necessary.

(8) Tighten the shift rod lock bolt to 10 N·m (90 in.lbs.).

(9) Remove the shifter adjustment locating pin from the adjustment channel and the locating hole.

(10) Lower vehicle.

(11) Install the transfer case shifter console.

(12) Install the shifter boot and the shifter knob onto the shifter lever.

(13) Install nut to hold shifter knob to shift lever.

(14) Install shifter knob cap.

(15) Verify transfer case operation.

80de77d0

SHIFT LEVER (Continued)

ADJUSTMENTS

ADJUSTMENT - SHIFT LEVER

- (1) Move shift lever into 2H position.
- (2) Raise vehicle.
- (3) Loosen shift rod lock bolt at trunnion.
- (4) Check shift rod fit in trunnion. Be sure rod does not bind in trunnion. Lubricate the shift rod and trunnion if necessary.
- (5) Verify that transfer case shift lever is in 2H detent position. The 2H detent position on the transfer case shift arm is the second position from full forward.
- (6) Align the adjustment locating hole on the lower shifter lever with the adjustment channel on the shifter bracket assembly (Fig. 90).

(7) Insert an appropriately sized pin through into the adjustment channel and through the locating hole to hold the shifter in the correct position.

(8) Tighten shift rod lock bolt to 10 N·m (90 in. lbs.) torque.

(9) Remove the locating pin from the adjustment channel and locating hole.

(10) Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

TRANSFER CASE - NV271

DESCRIPTION

The NV271 transfer case is a part-time transfer case with a low-range gear system. It provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability.

The gear cases and extension are all of aluminum (Fig. 1). Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

Fig. 1 Transfer Case - Front View

- 1 - TRANSFER CASE
- 2 - MANUAL LEVER
- 3 - POSITION SENSOR

TRANSFER CASE - NV271 (Continued)

IDENTIFICATION

An identification tag (Fig. 2) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

80f50fc1

Fig. 2 Transfer Case - Rear View

- 1 - TRANSFER CASE
2 - IDENTIFICATION TAG

OPERATION**OPERATING RANGE**

Transfer case operating ranges are:

- 2H (2-wheel drive)
- 4H (4-wheel drive)
- 4LO (4-wheel drive low range)

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a NEUTRAL detent. Lever range positions are imprinted in the shift knob.

SHIFTING

The transfer case can be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into and out of the 4L operating range.

DIAGNOSIS AND TESTING - TRANSFER CASE - NV271

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

TRANSFER CASE - NV271 (Continued)

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer Case difficult to shift or will not shift into desired range.	1) Vehicle speed too great to permit shifting. 2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind. 3) Transfer case external shift linkage binding. 4) Insufficient or incorrect lubricant. 5) Internal components binding, worn, or damaged.	1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift. 2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces. 3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary. 4) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid. 5) Disassemble the transfer case and replace worn or damaged components as necessary.
Transfer Case noisy in all operating ranges.	1) Insufficient or incorrect lubricant.	1) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid.
Noisy in, or jumps out of, four wheel drive low range.	1) Transfer case not completely engaged in 4L position. 2) Shift linkage out of adjustment. 3) Shift linkage loose or binding. 4) Range fork damaged, inserts worn, or fork is binding on the shift rail. 5) Low range gear worn or damaged.	1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position. 2) Adjust linkage. 3) Tighten, lubricate, or repair linkage as necessary. 4) Disassemble unit and repair as necessary. 5) Disassemble unit and repair as necessary.
Lubricant leaking from output shaft seal or vent.	1) Transfer case overfilled. 2) Vent closed or restricted. 3) Output shaft seals damaged or installed incorrectly.	1) Drain lubricant to the correct level. 2) Clear or replace vent as necessary. 3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal.
Abnormal tire wear.	1) Extended operation on hard, dry surfaces in the 4H position.	1) Operate vehicle in the 2H position on hard, dry surfaces.

TRANSFER CASE - NV271 (Continued)

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)
- (3) Position drain oil container under transfer case.
- (4) Remove transfer case drain plug and drain lubricant into container.
- (5) Disconnect vent hose and transfer case position sensor connector.
- (6) Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.
- (7) Support transmission with jack stand.
- (8) Mark front and rear propeller shafts for assembly reference.
- (9) Remove front and rear propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (10) Support transfer case with suitable jack. Secure transfer case to jack with safety chains.
- (11) Remove nuts attaching transfer case to transmission.
- (12) Move transfer case assembly rearward until free of transmission output shaft.
- (13) Lower jack and move transfer case from under vehicle.

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

COMPANION FLANGE AND EXTENSION HOUSING

- (1) Install two bolts 180° apart into the front output shaft companion flange.
- (2) Place holder over the bolts and against the companion flange (Fig. 3).
- (3) Remove and discard the front companion flange nut.
- (4) Remove the companion flange from the front output shaft. It may be necessary to use Flange puller 8992 to remove the companion flange.
- (5) Use a suitable chisel or pry tool to remove the rear extension housing dust boot (Fig. 4).
- (6) Use a suitable chisel or pry tool to remove the rear extension housing seal.

OIL PUMP AND REAR CASE

(1) Disengage the oil pump pick-up tube (Fig. 7) from the oil pump.

NOTE: The oil pump pick-up tube seals to the oil pump with an o-ring. Verify that the o-ring was removed with the tube and is in good condition. Replace the o-ring if necessary.

(2) Remove the oil pump (Fig. 8).

TRANSFER CASE - NV271 (Continued)

INPUT AND PLANETARY GEAR

(1) Remove input gear seal with suitable screw and slide hammer.

(2) Remove input gear retaining ring (Fig. 33) with heavy duty snap-ring pliers.

Fig. 33 Remove Input Gear Retaining Ring

- 1 - INPUT GEAR
- 2 - RETAINING RING

(3) Place front case in horizontal position. Then remove input gear and low range gear as an assembly (Fig. 34). Tap gear out of bearing with plastic mallet, if necessary.

Fig. 34 Remove Input Planetary Assembly

- 1 - FRONT CASE
- 2 - INPUT PLANETARY ASSEMBLY

(4) Remove snap-ring that retains input gear in the low range gear (Fig. 35).

(5) Remove retainer (Fig. 36).

Fig. 35 Remove Input Gear Retaining Ring

- 1 - INPUT GEAR
- 2 - RETAINING RING

Fig. 36 Remove Input Gear Retainer

- 1 - INPUT GEAR
- 2 - RETAINER

TRANSFER CASE - NV271 (Continued)

(6) Remove front thrust plate (Fig. 37).

80ff5517

Fig. 37 Remove Input Gear Thrust Plate

- 1 - INPUT GEAR
- 2 - THRUST PLATE

(7) Remove input gear (Fig. 38).

(8) Remove bottom tabbed thrust washer from low range planetary (Fig. 39).

80ff5523

Fig. 38 Remove Input Gear From Planetary

- 1 - INPUT GEAR
- 2 - LOW RANGE PLANETARY

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to

80ff5636

Fig. 39 Remove Bottom Input Gear Thrust Plate

- 1 - PLANETARY
- 2 - THRUST PLATE

remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone, however, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 40). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. Check the pinion gear thrust washers on the pinion pins for damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

TRANSFER CASE - NV271 (Continued)

80f15d36

Fig. 40 Input Gear And Carrier Components

- 1 - PLANETARY CARRIER
- 2 - REAR THRUST WASHER
- 3 - FRONT THRUST WASHER

- 4 - CARRIER LOCK RING
- 5 - CARRIER LOCK RETAINING RING
- 6 - INPUT GEAR

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 41). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

80010948

Fig. 41 Shift forks

- 1 - RANGE FORK
- 2 - MODE FORK AND RAIL
- 3 - MODE SPRING

Inspect the shift fork wear pads (Fig. 42). The mode and range fork pads are serviceable and can be replaced if necessary.

8001097c

Fig. 42 Shift Fork And Wear Pad Locations

- 1 - RANGE FORK
- 2 - MODE FORK
- 3 - WEAR PADS (SERVICEABLE)
- 4 - WEAR PADS (SERVICEABLE)

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

TRANSFER CASE - NV271 (Continued)

DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 43)

Fig. 43 Low Range Annulus Gear

- 1 - FRONT CASE
2 - LOW RANGE ANNULUS GEAR

FRONT CASE AND REAR CASE

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY**BEARINGS AND SEALS**

(1) Remove the input shaft bearing snap-ring from the front case half with suitable snap-ring pliers.

(2) Remove the input shaft bearing from the front case half with Installer 6953 and Handle C-4171 (Fig. 44).

(3) Install the input shaft bearing into the front case half with Installer 8151 inverted on Handle C-4171 (Fig. 45).

(4) Install the input shaft bearing snap-ring into the front case half with suitable snap-ring pliers.

Fig. 81 Case Magnet Installation

- 1 - MAGNET
- 2 - CASE POCKET

REAR CASE

(1) Install the oil pick-up tube and screen into the rear case half.

(2) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

(3) Align mainshaft with the rear output shaft mainshaft bearing and align shift rail with bore in rear case. Then install rear case (Fig. 82). Verify that the case alignment dowels correctly seat into their mating recesses.

(4) Install 4-5 rear case-to front case bolts (Fig. 83) to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

TRANSFER CASE - NV271 (Continued)

Fig. 82 Install Rear Case Half

- 1 - FRONT CASE HALF
- 2 - REAR CASE HALF

Fig. 84 Install Rear Bearing Inner Snap-Ring

- 1 - OUTPUT SHAFT
- 2 - REAR CASE HALF

- 2 - REAR OUTPUT SHAFT
- 3 - OIL PUMP

TRANSFER CASE - NV271 (Continued)

(2) Engage the oil pump pick-up tube (Fig. 86) into the oil pump. Verify that the pick-up tube o-ring is on the tube and is correctly installed to the oil pump.

Fig. 86 Engage The Oil Pick-up To Oil Pump

- 1 - OIL PUMP
- 2 - OIL PICK-UP TUBE

(3) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.

(4) Install extension housing (Fig. 87) onto the rear case half.

Fig. 87 Install Extension Housing

- 1 - REAR CASE HALF
- 2 - EXTENSION HOUSING

(5) Install rear extension bolts (Fig. 88). Tighten the bolts to 27-34 N·m (20-25 ft.lbs.).

Fig. 88 Install Extension Housing Bolts

- 1 - EXTENSION HOUSING
- 2 - BOLTS

(6) Install the extension housing boot and seal assembly with Installer 9037 and Handle C-4171 (Fig. 89).

Fig. 89 Install Extension Housing Seal

- 1 - EXTENSION HOUSING
- 2 - HANDLE C-4171
- 3 - INSTALLER 9037

TRANSFER CASE - NV271 (Continued)

- (7) Install the front companion flange onto the front output shaft.
- (8) Install two bolts 180° apart into the front output shaft companion flange.
- (9) Place holder over the bolts and against the companion flange (Fig. 90).
- (10) Install a new front companion flange nut. Tighten the companion flange nut to 176-271 N-m (130-200 ft.lbs.).

INSTALLATION

- (1) Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.
- (2) Install and tighten transfer case attaching nuts. Tighten nuts to 30-41 N-m (20-30 ft.lbs.).
- (3) Remove jack stand from under transmission.
- (4) Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (5) Connect vent hose and transfer case position sensor connector.
- (6) Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.
- (7) Adjust shift linkage, if necessary.

80ff4cb0

Fig. 90 Install Companion Flange Nut

- 1 - HOLDER 6719
- 2 - BOLTS

- (8) Fill transfer case with recommended transmission fluid and install fill plug.
- (9) Install skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)
- (10) Lower vehicle

EXTENSION HOUSING SEAL AND DUST BOOT

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Use a suitable chisel or pry tool to remove the rear extension housing dust boot (Fig. 91).
- (4) Use a suitable chisel or pry tool to remove the rear extension housing seal.

Fig. 91 Remove Extension Housing Dust Boot

- 1 - EXTENSION HOUSING
- 2 - DUST BOOT

Fig. 92 Install Extension Housing Seal

- 1 - EXTENSION HOUSING
- 2 - HANDLE C-4171
- 3 - INSTALLER 9037

INSTALLATION

- (1) Clean fluid residue from sealing surface and inspect for defects.
- (2) Install the extension housing dust boot and seal assembly with Installer 9037 and Handle C-4171 (Fig. 92).
- (3) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (4) Verify proper transfer case fluid level.
- (5) Lower vehicle.

FLUID

STANDARD PROCEDURE - FLUID DRAIN AND REFILL

The fill and drain plugs are both in the rear case (Fig. 93).

- (1) Raise vehicle.

Fig. 93 Drain and Fill Locations

- 1 - FILL HOLE
- 2 - DRAIN HOLE

- (2) Position drain pan under transfer case.
- (3) Remove drain and fill plugs and drain lubricant completely.
- (4) Install drain plug. Tighten plug to 41-54 N-m (30-40 ft. lbs.).
- (5) Remove drain pan.

FLUID (Continued)

(6) Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, Automatic Transmission fluid.

(7) Install and tighten fill plug to 41-54 N-m (30-40 ft. lbs.).

(8) Lower vehicle.

FRONT OUTPUT SHAFT SEAL

REMOVAL

(1) Remove the front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL).

(2) Install two bolts 180° apart into the front output shaft companion flange.

(3) Place holder over the bolts and against the companion flange (Fig. 94).

(4) Remove and discard the front companion flange nut.

(5) Remove the companion flange from the front output shaft. It may be necessary to use Flange puller 8992 to remove the companion flange.

Fig. 94 Remove Companion Flange Nut

1 - HOLDER 6719
2 - BOLTS

(6) Using a screw and a slide hammer, remove the front output shaft seal.

INSTALLATION

(1) Install the new front output shaft seal with Installer MB991168A.

(2) Install the front companion flange onto the front output shaft.

(3) Install two bolts 180° apart into the front output shaft companion flange.

(4) Place holder over the bolts and against the companion flange (Fig. 95).

(5) Install a new front companion flange nut. Tighten the companion flange nut to 258-312 N-m (190-230 ft.lbs.).

80ff4cb0

Fig. 95 Install Companion Flange Nut

1 - HOLDER 6719
2 - BOLTS

(6) Install front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

POSITION SENSOR

DESCRIPTION

The transfer case position sensor is an electronic device whose output can be interpreted to indicate the transfer case's current operating mode. The sensor consists of a five position, resistive multiplexed circuit which returns a specific resistance value to the Powertrain Control Module (PCM) for each transfer case operating mode. The sensor is located on the top of the transfer case, just left of the transfer case centerline and rides against the sector plate roostercomb. The PCM supplies 5VDC (+/- 0.5V) to the sensor and monitors the return voltage to determine the sector plate, and therefore the transfer case, position.

OPERATION

During normal vehicle operation, the Powertrain Control Module (PCM) monitors the transfer case position sensor return voltage to determine the operating mode of the transfer case. Refer to the Operating Mode Versus Resistance table for the correct resistance for each position (Fig. 96).

POSITION SENSOR (Continued)

OPERATING MODE VERSUS RESISTANCE

SENSOR POSITION	OPERATING MODE	SENSOR RESISTANCE (ohms)
1	2H	1172-1195
2	4H	677-691
3	NEUTRAL	406-415
4	4L	208-213
5	NOT USED	60-61

80cd3d70

Fig. 96 Position Sensor Linear Movement

- 1 - POSITION 1 - 10mm ±0.5mm
- 2 - POSITION 2 - 12mm ±0.5mm
- 3 - POSITION 3 - 14mm ±0.5mm
- 4 - POSITION 4 - 16mm ±0.5mm
- 5 - POSITION 5 - 18mm ±0.5mm
- 6 - POSITION 6 - 20mm ±0.5mm - FULL EXTENSION

REMOVAL

- (1) Raise and support the vehicle.
- (2) Disengage the transfer case position sensor connector from the position sensor.
- (3) Remove the position sensor from the transfer case.

INSTALLATION

- (1) Inspect the o-ring seal on the transfer case position sensor. Replace the o-ring if necessary.
- (2) Install the transfer case position sensor into the transfer case. Torque the sensor to 20-34 N·m (15-25 ft.lbs.).
- (3) Engage the transfer case position sensor connector to the position sensor.
- (4) Lower vehicle.
- (5) Verify proper sensor operation.

SHIFT LEVER

REMOVAL

- (1) Shift transfer case into 2H.
- (2) Raise and support the vehicle.
- (3) Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel to come out of trunnion, push trunnion out of shift lever.
- (4) Lower vehicle.
- (5) Remove transfer case shifter knob cap.
- (6) Remove nut holding shifter knob to shift lever.
- (7) Remove shifter knob.
- (8) Remove the shift boot from the shifter console.
- (9) Remove the bolts securing the shifter mechanism to the floor pan (Fig. 97).
- (10) Separate shift lever mechanism from the vehicle.

80de77d0

Fig. 97 Transfer Case Shifter

1 - SHIFTER BOOT
 2 - SHIFTER KNOB
 3 - SHIFTER CONSOLE

4 - SHIFTER MECHANISM
 5 - ALIGNMENT PIN
 6 - TRANSFER CASE

SHIFT LEVER (Continued)

INSTALLATION

(1) If the shifter mechanism does not have a adjustment locating pin installed, align the adjustment channel on the shifter assembly to the locating hole in the lower shift lever and install an appropriately sized pin to retain the position (Fig. 98).

(2) Position shift lever in vehicle.

(3) Install the bolts to hold the shifter mechanism to the floor pan.

(4) Raise vehicle.

(5) Verify that the transfer case is still in the 2H position. The 2H detent position on the transfer case shift arm is the second position from full forward.

(6) Install trunnion to shift lever, if necessary.

(7) Install shift rod to trunnion, if necessary.

(8) Tighten the shift rod lock bolt to 10 N·m (90 in.lbs.).

(9) Remove the shifter adjustment locating pin from the adjustment channel and the locating hole.

(10) Lower vehicle.

(11) Install the transfer case shifter console.

(12) Install the shifter boot and the shifter knob onto the shifter lever.

(13) Install nut to hold shifter knob to shift lever.

(14) Install shifter knob cap.

(15) Verify transfer case operation.

SHIFT LEVER (Continued)

ADJUSTMENTS

ADJUSTMENT - SHIFT LEVER

- (1) Move shift lever into 2H position.
- (2) Raise vehicle.
- (3) Loosen shift rod lock bolt at trunnion.
- (4) Check shift rod fit in trunnion. Be sure rod does not bind in trunnion. Lubricate the shift rod and trunnion if necessary.
- (5) Verify that transfer case shift lever is in 2H detent position. The 2H detent position on the transfer case shift arm is the second position from full forward.
- (6) Align the adjustment locating hole on the lower shifter lever with the adjustment channel on the shifter bracket assembly (Fig. 99).

(7) Insert an appropriately sized pin through into the adjustment channel and through the locating hole to hold the shifter in the correct position.

(8) Tighten shift rod lock bolt to 10 N·m (90 in. lbs.) torque.

(9) Remove the locating pin from the adjustment channel and locating hole.

(10) Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

TRANSFER CASE - NV243

DESCRIPTION

The NV243 is an electronically controlled part-time transfer case with a low range gear reduction system. The NV243 has three operating ranges plus a NEUTRAL position. The low range system provides a gear reduction ratio for increased low speed torque capability.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum retainer housings bolted to the case halves.

OPERATING RANGES

Transfer case operating ranges are:

- 2WD (2-wheel drive)
- 4HI (4-wheel drive)
- 4LO (4-wheel drive low range)
- NEUTRAL

The 2WD range is for use on any road surface at any time.

The 4HI and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is wet or slippery or covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

SHIFT MECHANISM

Operating ranges are selected with a dash mounted shift selector switch. The shift selector switch provides a input to the Transfer Case Control Module (TCCM) to indicate the driver's desire to change operating ranges. The TCCM uses this input, along with input from the transfer case mounted mode sensor and information from the vehicle's bus, to determine if a shift is permitted. If the TCCM decides the shift is permitted, the TCCM controls the shift motor, mounted to the exterior of the transfer case, to perform the shift.

TRANSFER CASE - NV243 (Continued)

IDENTIFICATION

A circular ID tag is attached to the rear case of each transfer case (Fig. 1). The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the planetary assembly and range sleeve. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is engaged/disengaged by the mode fork, which operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchronizer mechanism for shifting.

DIAGNOSIS AND TESTING - TRANSFER CASE - NV243

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case electronically controlled shift system malfunction.	1) Verify proper operation per the appropriate diagnostic manual.
	2) If vehicle was operated for an extended period in 4HI mode on dry surface, driveline torque load may cause difficulty.	2) Drive the vehicle in a straight line and momentarily release the accelerator. The transfer case can then be shifted to the desired mode.
	3) Insufficient or incorrect lubricant.	3) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	4) Internal transfer case components binding, worn, or damaged.	4) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, type 9602, Automatic Transmission Fluid.
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.

TRANSFER CASE - NV243 (Continued)

Condition	Possible Cause	Correction
Transfer case noisy while in, or jumps out of, 4LO mode.	1) Transfer case not completely engaged in 4LO position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL, or clutch depressed on vehicles equipped with a manual transmission, shift transfer case to the 2WD or 4HI position, and then back into the 4LO position.
	2) Range fork damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Abnormal tire wear.	1) Extended operation in 4HI mode on dry surfaces,	1) Operate vehicle in 2WD mode on dry surfaces.

REMOVAL

- (1) Shift transfer case into 2WD.
- (2) Raise vehicle.
- (3) Drain transfer case lubricant.
- (4) Mark front and rear propeller shafts for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove the transfer case skid plate, if equipped.
- (7) Disconnect front and rear propeller shafts at transfer case.
- (8) Disconnect transfer case shift motor and mode sensor wire connectors.
- (9) Disconnect transfer case vent hose.
- (10) Support transfer case with transmission jack.
- (11) Secure transfer case to jack with chains.
- (12) Remove nuts attaching transfer case to transmission (Fig. 2).
- (13) Pull transfer case and jack rearward to disengage transfer case.
- (14) Remove transfer case from under vehicle.

80de7845

Fig. 2 Remove Transfer Case - Typical

- 1 - TRANSMISSION
- 2 - TRANSFER CASE
- 3 - MODE SENSOR CONNECTOR

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

TRANSFER CASE - NV243 (Continued)

SHIFT MOTOR ASSEMBLY AND FRONT OUTPUT SHAFT SEAL

(1) Remove the bolts (Fig. 3) which hold the shift motor and mode sensor assembly to the transfer case.

80ab4eae

Fig. 3 Remove the Shift Motor and Mode Sensor Assembly Bolts - Typical

- 1 - TRANSFER CASE
- 2 - SHIFT MOTOR AND MODE SENSOR ASSEMBLY
- 3 - BOLT

(2) Remove the shift motor and mode sensor assembly from the transfer case.

(3) Remove the front propeller shaft seal boot retaining clamp (Fig. 4).

80de4617

Fig. 4 Remove Boot Clamp - Typical

- 1 - SEAL BOOT
- 2 - BOOT CLAMP

(4) Remove the front propeller shaft seal boot (Fig. 5).

(5) Remove the front output shaft seal slinger by bending (Fig. 6) the slinger ears away from the transfer case.

80de4615

Fig. 5 Remove Seal Boot - Typical

- 1 - SEAL BOOT
- 2 - SEAL SLINGER

80de4613

Fig. 6 Bend Slinger Ears - Typical

- 1 - SLINGER
- 2 - BEND UPWARD

TRANSFER CASE - NV243 (Continued)

(6) Using a suitable pry tool (Fig. 7), remove the slinger from the output shaft using care not to damage the shaft.

80de4611

Fig. 7 Remove Slinger From Shaft - Typical

- 1 - SLINGER
- 2 - PRY TOOL

(7) Using a screw and a slide hammer, remove the front output shaft seal.

REAR EXTENSION

(1) Remove rear extension bolts (Fig. 8).

80de460f

Fig. 8 Remove Rear Extension Bolts

- 1 - EXTENSION HOUSING
- 2 - TRANSFER CASE

(2) Remove rear extension housing (Fig. 9). Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

80de460d

Fig. 9 Remove Rear Extension

- 1 - EXTENSION HOUSING
- 2 - TRANSFER CASE
- 3 - PRY SLOT

(3) Remove output bearing retaining ring with heavy duty snap-ring pliers (Fig. 10).

80de460b

Fig. 10 Remove Output Shaft Retaining Ring

- 1 - REAR OUTPUT SHAFT
- 2 - OUTPUT SHAFT BEARING
- 3 - RETAINING RING
- 4 - TRANSFER CASE

TRANSFER CASE - NV243 (Continued)

OIL PUMP AND REAR CASE

(1) Remove rear case-to-front case bolts (Fig. 11).

Fig. 11 Remove Case Bolts

- 1 - REAR CASE
- 2 - FRONT CASE
- 3 - BOLT

(2) Loosen rear case with pry tool to break sealer bead. Insert tool in slot at each end of case (Fig. 12).

Fig. 12 Loosen Case Halves

- 1 - REAR CASE
- 2 - FRONT CASE
- 3 - PRY SLOTS

(3) Unseat rear case from alignment dowels.

(4) Remove rear case and oil pump assembly from front case (Fig. 13).

Fig. 13 Remove Rear Case

- 1 - REAR CASE
- 2 - FRONT CASE

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft inner bearing race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly **MUST** be replaced.

(5) Remove the oil pump pickup tube.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Remove shift rail cup and spring (Fig. 14).

Fig. 14 Shift Rail Cup And Spring Removal

- 1 - SHIFT RAIL
- 2 - SPRING
- 3 - CUP

TRANSFER CASE - NV243 (Continued)

(2) Remove front sprocket retaining ring (Fig. 15).

J9421-287

Fig. 15 Removing Front Sprocket Retaining Ring

- 1 - FRONT SPROCKET
- 2 - RETAINING RING
- 3 - FRONT OUTPUT SHAFT

(3) Pull mainshaft, front sprocket and chain outward about 25.4 mm (1-inch) simultaneously (Fig. 16).

(4) Remove chain from mainshaft drive sprocket and remove front sprocket and chain as assembly.

80de4600

Fig. 16 Remove Front Sprocket and Drive Chain

- 1 - FRONT DRIVE SPROCKET
- 2 - DRIVE CHAIN
- 3 - MAINSHAFT

SHIFT FORKS AND MAINSHAFT

(1) Loosen detent plug.

(2) Remove detent plug, spring, and plunger (Fig. 17). Note that the plug has an O-ring seal. Remove and discard this seal.

80de45fb

Fig. 17 Remove Detent Plug, Spring, and Plunger

- 1 - FRONT CASE
- 2 - DETENT PLUG
- 3 - DETENT SPRING
- 4 - DETENT PLUNGER

(3) Remove the front output shaft snap-ring (Fig. 18).

80de45f9

Fig. 18 Remove Front Output Shaft Snap-ring - Typical

- 1 - FRONT OUTPUT SHAFT
- 2 - SNAP-RING

TRANSFER CASE - NV243 (Continued)

(4) Remove front output shaft from bearing in case (Fig. 19).

Fig. 19 Remove Front Output Shaft

- 1 - FRONT CASE
- 2 - FRONT OUTPUT SHAFT

(5) Pull mainshaft assembly out of input gear, mode sleeve, and case (Fig. 20).

Fig. 20 Remove Mainshaft

- 1 - FRONT CASE
- 2 - MAINSHAFT

(6) Remove mode fork, mode sleeve, and shift rail as assembly (Fig. 21). Note which way the sleeve fits in the fork (long side of sleeve goes to front).

Fig. 21 Mode Fork And Sleeve Removal

- 1 - MODE SLEEVE
- 2 - MODE FORK AND RAIL

(7) Remove range fork retaining ring.
 (8) Remove range fork and hub as an assembly (Fig. 22). Note fork position for installation reference.

Fig. 22 Range Fork And Hub Removal

- 1 - RANGE HUB
- 2 - RANGE FORK

TRANSFER CASE - NV243 (Continued)

- (9) Remove shift sector (Fig. 23).
- (10) Remove the shift sector o-ring (Fig. 24).

Fig. 23 Shift Sector Removal

80de5394

(5) Remove the mode hub retaining ring (Fig. 30) from the output shaft.

Fig. 30 Remove Retaining Ring

- 1 - OUTPUT SHAFT
- 2 - RETAINING RING
- 3 - MODE HUB

80de5392

TRANSFER CASE - NV243 (Continued)

(6) Remove the mode hub (Fig. 31) from the output shaft.

Fig. 31 Remove Mode Hub

- 1 - OUTPUT SHAFT
- 2 - MODE HUB

(3) Place front case in horizontal position. Then remove input gear and low range gear as an assembly (Fig. 33). Tap gear out of bearing with plastic mallet, if necessary.

Fig. 33 Remove Input Planetary Assembly

- 1 - FRONT CASE
- 2 - INPUT PLANETARY ASSEMBLY

INPUT AND PLANETARY GEAR

(1) Remove input gear seal with suitable screw and slide hammer.

(2) Remove input gear retaining ring (Fig. 32) with heavy duty snap-ring pliers.

Fig. 32 Remove Input Gear Retaining Ring

- 1 - INPUT GEAR
- 2 - RETAINING RING

INPUT AND PLANETARY GEAR

(1) Remove snap-ring that retains input gear in low range gear (Fig. 34).

Fig. 34 Input Gear Snap-Ring Removal

- 1 - INPUT GEAR SNAP-RING

TRANSFER CASE - NV243 (Continued)

- (2) Remove retainer (Fig. 35).
- (3) Remove front tabbed thrust washer (Fig. 36).
- (4) Remove input gear (Fig. 37).
- (5) Remove rear tabbed thrust washer from low range gear (Fig. 38).

Fig. 35 Input Gear Retainer Removal

- 1 - INPUT GEAR
- 2 - LOW RANGE GEAR
- 3 - RETAINER

Fig. 36 Front Tabbed Thrust Washer Removal

- 1 - FRONT TABBED THRUST WASHER

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

Fig. 37 Input Gear Removal

- 1 - INPUT GEAR
- 2 - LOW RANGE GEAR

Fig. 38 Rear Tabbed Thrust Washer Removal

- 1 - LOW RANGE GEAR
- 2 - REAR TABBED THRUST WASHER

INSPECTION

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

TRANSFER CASE - NV243 (Continued)

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 39). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 40). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

80b49eaf

Fig. 40 Shift Forks

- 1 - RANGE FORK

- 3 - FRONT THRUST WASHER
- 4 - CARRIER LOCK RING
- 5 - CARRIER LOCK RETAINING RING
- 6 - INPUT GEAR

TRANSFER CASE - NV243 (Continued)

Inspect the shift fork wear pads (Fig. 41). The mode and range fork pads are serviceable and can be replaced if necessary.

Fig. 41 Shift Fork And Wear Pad Locations

- 1 - RANGE FORK
- 2 - MODE FORK
- 3 - WEAR PADS (SERVICEABLE)
- 4 - WEAR PADS (SERVICEABLE)

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

REAR EXTENSION HOUSING

Inspect the extension housing seal and bushing. Replace both components if either show any sign of wear or damage.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Inspect the shaft threads, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the threads are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 42)

Fig. 42 Low Range Annulus Gear

- 1 - FRONT CASE
- 2 - LOW RANGE ANNULUS GEAR

FRONT AND REAR CASES

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil® stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

TRANSFER CASE - NV243 (Continued)

ASSEMBLY

BEARINGS AND SEALS

(1) Remove the input shaft bearing (Fig. 43) from the front case with suitable snap-ring pliers.

(2) Transfer the retaining ring to the new bearing if necessary and install the bearing into the front case.

80de58aa

Fig. 43 Remove Input Gear Bearing

- 1 - INPUT GEAR BEARING
- 2 - FRONT CASE

(3) Using Installer 6436 and Handle C-4171 (Fig. 44), remove front output shaft bearing.

(4) Start front output shaft bearing in case. Then seat bearing with Handle C-4171 and Installer 6953.

80de5977

Fig. 44 Remove Front Output Shaft Bearing

- 1 - FRONT CASE
- 2 - INSTALLER 6436
- 3 - HANDLE C-4171

(5) Install front output shaft bearing retaining ring.

(6) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 45).

(7) Install new pilot bearing with Remover/Installer 8684.

80a11090

Fig. 45 Remove Input Gear Pilot Bearing

- 1 - DRIFT
- 2 - INPUT GEAR

TRANSFER CASE - NV243 (Continued)

(8) Remove the front output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 46).

(9) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 47). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 48).

INPUT AND PLANETARY GEAR

(1) Lubricate gears and thrust washers (Fig. 51) with recommended transmission fluid.

(2) Install first thrust washer in low range gear (Fig. 51). Be sure washer tabs are properly aligned in gear notches.

(3) Install input gear in low range gear. Be sure input gear is fully seated.

(4) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(5) Install retainer on input gear and install snap-ring.

Fig. 51 Input/Low Range Gear Components

- 1 - SNAP-RING
- 2 - RETAINER PLATE
- 3 - INPUT GEAR
- 4 - LOW RANGE GEAR
- 5 - THRUST WASHERS

TRANSFER CASE - NV243 (Continued)

(6) Align and install low range/input gear assembly in front case (Fig. 52). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

(7) Install snap-ring to hold input/low range gear into front bearing (Fig. 53).

(8) Install a new input gear seal using Installer 8841 and Handle C-4171.

Fig. 52 Install Input Planetary Assembly

- 1 - FRONT CASE
- 2 - INPUT PLANETARY ASSEMBLY

SHIFT FORKS AND MAINSHAFT

(1) Lubricate mainshaft splines with recommended transmission fluid.

(2) Install the mode hub (Fig. 54) onto the output shaft.

(3) Install the mode hub retaining ring (Fig. 55) onto the output shaft.

Fig. 54 Install Mode Hub

TRANSFER CASE - NV243 (Continued)

OIL PUMP AND REAR CASE

Lubricate the oil pump components with transmission fluid before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft inner bearing race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly **MUST** be replaced.

(1) Install new o-ring in pickup tube inlet of oil pump.

(2) Insert oil pickup tube into the oil pump.

(3) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

(4) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 73).

80de4602

Fig. 73 Install Rear Case

- 1 - REAR CASE
- 2 - FRONT CASE

(5) Install 4-5 rear case-to front case bolts (Fig. 74) to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail, and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are mis-aligned.

(6) Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts. Tighten bolts to 20-27 N-m (15-24 ft. lbs.),

(7) Install rear output bearing snap-ring (Fig. 75) to output shaft.

80de4609

Fig. 74 Install Case Bolts - Typical

SEAL BOOT AND SHIFT MOTOR ASSEMBLY

(1) Install the front output shaft seal slinger with Installer 8840. Install the slinger onto the shaft until the tool contacts the rear of the output shaft.

(2) Install a new seal boot clamp onto the seal boot.

(3) Install the seal boot and clamp onto the slinger hub and tighten the clamp with Crimp Tool C-4975-A.

TRANSFER CASE - NV243 (Continued)

(4) Position the shift motor and mode sensor assembly onto the transfer case.

(5) Install the bolts to hold the shift motor and mode sensor assembly to the transfer case. Tighten the bolts to 16-25 N-m (12-18 ft. lbs.).

REAR EXTENSION

(1) Install new seal in rear extension housing seal with Installer D-163 and Handle C-4171..

(2) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.

(3) Align and install rear extension on retainer (Fig. 76).

(4) Apply Mopar® Silicone Sealer to threads of rear extension housing bolts. Then install and tighten bolts to 16-24 N-m (12-18 ft. lbs.) torque.

80de460f

Fig. 76 Install Rear Extension Bolts

1 - EXTENSION HOUSING
2 - TRANSFER CASE

INSTALLATION

- (1) Mount transfer case on a transmission jack.
- (2) Secure transfer case to jack with chains.
- (3) Position transfer case under vehicle.
- (4) Align transfer case and transmission shafts and install transfer case onto the transmission.
- (5) Install and tighten transfer case attaching nuts to 27-34 N-m (20-25 ft. lbs.) torque.
- (6) Connect the vent hose.
- (7) Connect the shift motor and mode sensor wiring connectors. Secure wire harness to clips on transfer case.

- (8) Align and connect the propeller shafts.
- (9) Fill transfer case with correct fluid. (Refer to 21 - TRANSMISSION/TRANSFER CASE/FLUID - STANDARD PROCEDURE)
- (10) Install skid plate, if equipped.
- (11) Remove transmission jack and support stand.
- (12) Lower vehicle and verify transfer case shift operation.

EXTENSION HOUSING SEAL

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.

INSTALLATION

- (1) Clean fluid residue from sealing surface and inspect for defects.
- (2) Using Installer D-163, install seal in extension housing (Fig. 77).

Fig. 77 Install Rear Seal in Extension Housing

- 1 - SPECIAL TOOL C-4171
- 2 - SPECIAL TOOL D-163

- (3) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (4) Verify proper transfer case fluid level.
- (5) Lower vehicle.

FLUID

STANDARD PROCEDURE - FLUID DRAIN AND REFILL

The fill and drain plugs are both in the rear case (Fig. 78).

- (1) Raise vehicle.
- (2) Position drain pan under transfer case.
- (3) Remove drain and fill plugs and drain lubricant completely.
- (4) Install drain plug. Tighten plug to 20-34 N·m (15-25 ft. lbs.).
- (5) Remove drain pan.
- (6) Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, Automatic Transmission fluid.
- (7) Install and tighten fill plug to 20-34 N·m (15-25 ft. lbs.).
- (8) Lower vehicle.

(6) Using a screw and a slide hammer, remove the front output shaft seal.

INSTALLATION

(1) Install the new front output shaft seal with Installer MB991168A

(2) Install the front output shaft seal slinger with Installer 8840. Install the slinger onto the shaft until the tool contacts the rear of the output shaft.

(3) Install a new seal boot clamp onto the seal boot.

(4) Install the seal boot and clamp onto the slinger hub and tighten the clamp with Crimp Tool C-4975-A.

(5) Install front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

MODE SENSOR

DESCRIPTION

The transfer case mode sensor (Fig. 83) is an electronic device whose output can be interpreted to indicate the shift motor shaft's rotary position. The sensor consists of a magnetic ring and four Hall Effect Transistors to create a 4 channel digital device (non-contacting) whose output converts the motor shaft position into a coded signal. The TCCM must supply 5VDC (+/- 0.5v) to the sensor and monitor the shift motor position. The four channels are denoted A, B, C, and D. The sensor is mechanically linked to the shaft of the cam which causes the transfer case shifting. The mode sensor draws less than 53 mA.

OPERATION

During normal vehicle operation, the Transfer Case Control Module (TCCM) monitors the mode sensor outputs at least every 250 (+/-50) milliseconds when the shift motor is stationary and 400 microseconds when the shift motor is active. A mode sensor signal between 3.8 Volts and 0.8 Volts is considered to be undefined.

Refer to SECTOR ANGLES vs. TRANSFER CASE POSITION for the relative angles of the transfer case shift sector versus the interpreted transfer case gear operating mode. Refer to MODE SENSOR CHANNEL STATES for the sensor codes returned to the TCCM for each transfer case mode sensor position. The various between gears positions can also be referred as the transfer case's coarse position. These coarse positions come into play during shift attempts.

Fig. 83 Mode Sensor

80ac0f95

1 - MODE SENSOR

SECTOR ANGLES VS. TRANSFER CASE POSITION

Shaft Angle (Degrees)	Transfer Case Position
+40	4LO

SELECTOR SWITCH

DESCRIPTION

The selector switch assembly (Fig. 84) is mounted in the left side of the vehicle's Instrument Panel (IP) and consists of a rotary knob connected to a resistive network for the mode and range shift selections. Also located in this assembly is a recessed, normally open momentary switch for making shifts into and out of transfer case NEUTRAL. A pen, or similar instrument, is used to make a NEUTRAL shift selection, thus reducing the likelihood of an inadvertent shift request.

The selector switch also contains four light emitting diode's (LED's) to indicate the transfer case position and whether a shift is in progress.

TRANSFER CASE SELECTOR SWITCH

80da1af4

Fig. 84 Transfer Case Selector Switch

1 - SELECTOR SWITCH

OPERATION

As the position of the selector switch varies, the resistance between the Mode Sensor supply voltage pin and the Mode Sensor output will vary. Hardware, software, and calibrations within the Transfer Case Control Module (TCCM) are provided that interpret the selector switch resistance as given in the table below: SELECTOR SWITCH INTERPRETATION

SELECTOR SWITCH INTERPRETATION

Step	Resistance Range (ohms)	Required Interpretation
A	<200	Shorted
B	400-700	NEUTRAL
C	1050-1450	4LO
D	1850-2300	4HI
E	3050-5950	2WD (Default)
F	9.5-12.5K	In between positions
G	>15.5K	Open

For resistances between the ranges B-E shown for each valid position (T-Case NEUTRAL, 4LO, 4HI, 2WD), the TCCM may interpret the resistance as:

- either of the neighboring valid positions.
- as an invalid fault position.

For resistances between the ranges E and F shown for 2WD and in-between positions, the TCCM may interpret the resistance as:

- the 2WD position.
- an invalid fault position.
- a valid in-between position.

For resistances between the ranges F and G shown for in-between positions and fault condition (open), the TCCM may interpret the resistance as:

- a valid in-between position.
- an invalid fault position.

For resistances between the ranges A and B shown for the fault condition (short) and , T-Case NEUTRAL, the TCCM may interpret the resistance as:

- the T-Case NEUTRAL position.
- an invalid fault position.

The LED's in the selector assembly are illuminated/flashed in the following manner to indicate a particular condition or state.

- A solidly illuminated LED indicates a successfully completed shift and the current operating mode of the transfer case. While a shift has been requested but not yet completed, the LED for the desired transfer case position is flashed.

SELECTOR SWITCH (Continued)

- A flashing operating mode LED for the desired gear indicates that a shift to that position has been requested, but all of the driver controllable conditions have not been met. This is in an attempt to notify the driver that the transmission needs to be put into NEUTRAL, the vehicle speed is too great, or some other condition outlined (other than a diagnostic failure that would prevent this shift) elsewhere (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - OPERATION) is not met. Note that this flashing will continue indefinitely until the conditions are eventually met, or the selector switch position is changed, or if diagnostic routines no longer allow the requested shift.

- If the driver attempts to make a shift into transfer case NEUTRAL, and any of the driver controllable conditions are not met, the request will be ignored until all of the conditions are met or until the NEUTRAL select button is released. Additionally the neutral lamp will flash, or begin to flash while the button is depressed and operator controllable conditions are not being met. All of the LED's except the Neutral will flash if any of the operator controllable conditions for shifting are not met while the Neutral button is depressed. This "toggle" type of feature is necessary because the TCCM would interpret another request immediately after the shift into transfer case NEUTRAL has completed.

- No LED's illuminated indicate a fault in the transfer case control system.

SHIFT MOTOR

DESCRIPTION

The shift motor (Fig. 85) consists of a permanent magnet D.C. motor with gear reduction to convert a high speed-low torque device into a low speed-high torque device. The output of the device is coupled to a shaft which internally moves the mode and range forks that change the transfer case operating ranges. The motor is rated at 25 amps maximum at 72° F with 10 volts at the motor leads.

OPERATION

The transfer case shift motor responds to the Transfer Case Control Module (TCCM) commands to move the transfer case shift sector bi-directionally, as required, to obtain the transfer case operating mode indicated by the instrument panel mounted selector switch.

REMOVAL

NOTE: New shift motor assemblies are shipped in the 2WD/AWD position. If a new shift motor assembly will be installed, it will be necessary to shift the transfer case to the 2WD/AWD position prior to motor removal.

80ac0e3e

Fig. 85 Shift Motor - Shown Inverted - Typical

1 - SHIFT MOTOR

- (1) Raise the vehicle on a suitable hoist.
- (2) Disengage the wiring connectors from the shift motor and mode sensor.
- (3) Remove the bolts holding the shift motor and mode sensor assembly onto the transfer case.
- (4) Separate the shift motor and mode sensor assembly from the transfer case.

INSTALLATION

- (1) Verify that the shift sector o-ring is clean and properly positioned over the shift sector and against the transfer case.

NOTE: Verify that the shift motor position and sector shaft orientation are aligned. It may be necessary to manually shift the transfer case if the shift motor and sector shaft are not aligned.

- (2) Position the shift motor and mode sensor assembly onto the transfer case.
- (3) Install the bolts to hold the assembly onto the transfer case. Tighten the bolts to 16-24 N·m (12-18 ft.lbs.).

CAUTION: If the original shift motor and mode sensor assembly bolts are reused, be sure to use Mopar® Lock & Seal or Loctite™ 242 to replenish the lock patch material originally found on the bolts

- (4) Engage the wiring connectors to the shift motor and mode sensor.
- (5) Refill the transfer case as necessary.
- (6) Lower vehicle and verify transfer case operation.

TRANSFER CASE - NV244 GENII

DESCRIPTION

The NV244 GENII is an electronically controlled full and part-time transfer case with no two wheel drive operation.

A differential in the transfer case is used to control torque transfer to the front and rear axles. A low range gear reduction system provides increased low speed torque capability for off road operation. The low range provides a 2.72:1 reduction ratio.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum retainer housings bolted to the case halves.

OPERATING RANGES

NV244 GENII operating ranges are:

- AWD(All-Wheel Drive)
- 4HI (Part-time)
- 4LO
- NEUTRAL

The AWD mode can be used at any time and on any road surface.

The 4HI (Part-time) and 4LO ranges are for off road use only. The only time these ranges can be used is when the road surface is covered with snow, ice, or other loose slippery material.

SHIFT MECHANISM

Operating ranges are selected with a dash mounted shift selector switch. The shift selector switch provides a input to the Transfer Case Control Module (TCCM) to indicate the driver's desire to change operating ranges. The TCCM uses this input, along with the input from the transfer case mounted mode sensor and information from the vehicle's bus, to determine if a shift is permitted. If the TCCM decides the shift is permitted, the TCCM controls the shift motor, mounted to the exterior of the transfer case, to perform the shift.

TRANSFER CASE - NV244 GENII (Continued)

IDENTIFICATION

A circular ID tag is attached to the rear case of each transfer case (Fig. 1). The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the planetary assembly and range sleeve. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is splined to a differential assembly. Depending on the position of the mode fork and sleeve, the front output shaft is driven directly by the mainshaft or through the differential. The mode fork operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchronizer mechanism for shifting.

DIAGNOSIS AND TESTING - TRANSFER CASE - NV244

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case electronically controlled shift system malfunction.	1) Verify proper operation per the appropriate diagnostic manual.
	2) Insufficient or incorrect lubricant.	2) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	3) Internal transfer case components binding, worn, or damaged.	3) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.
Transfer case noisy while in, or jumps out of, 4LO.	1) Transfer case not completely engaged in 4LO position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL, or the clutch depressed on vehicles equipped with a manual transmission, shift the transfer case to the AWD or 4HI position, and then back into the 4LO position.
	2) Range fork damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.

TRANSFER CASE - NV244 GENII (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Transfer case will not shift through 4HI (Part-time) range.	1) Incomplete shift due to drivetrain torque load.	1) Drive in a straight line and momentarily release the accelerator pedal to complete the shift.
	2) Incorrect tire pressure.	2) Correct tire pressure as necessary.
	3) Excessive tire wear.	3) Correct tire condition as necessary.
	4) Excessive vehicle loading.	4) Correct as necessary.

REMOVAL

- (1) Shift transfer case into AWD.
- (2) Raise vehicle.
- (3) Drain transfer case lubricant.
- (4) Mark front and rear propeller shafts for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove the transfer case skid plate, if equipped.
- (7) Disconnect front and rear propeller shafts at transfer case.
- (8) Disconnect transfer case shift motor and mode sensor wire connectors.
- (9) Disconnect transfer case vent hose.
- (10) Support transfer case with transmission jack.
- (11) Secure transfer case to jack with chains.
- (12) Remove nuts attaching transfer case to transmission (Fig. 2).

Fig. 2 Remove Transfer Case - Typical

- 1 - TRANSMISSION
- 2 - TRANSFER CASE
- 3 - MODE SENSOR CONNECTOR

- (13) Pull transfer case and jack rearward to disengage transfer case.
- (14) Remove transfer case from under vehicle.

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

SHIFT MOTOR ASSEMBLY AND FRONT OUTPUT SHAFT SEAL

- (1) Remove the bolts (Fig. 3) which hold the shift motor and mode sensor assembly to the transfer case.

Fig. 37 Input Gear Removal

1 - INPUT GEAR
2 - LOW RANGE GEAR

(4) Remove input gear (Fig. 37).

(5) Remove rear tabbed thrust washer from low range gear (Fig. 38).

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 39). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail. Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads (Fig. 40). The mode and range fork pads are serviceable and can be replaced if necessary.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

TRANSFER CASE - NV244 GENII (Continued)

Fig. 39 Input Gear and Carrier Components

8001b75d

Fig. 40 Shift Fork and Wear Pad Locations

- 1 - RANGE FORK
- 2 - MODE FORK
- 3 - WEAR PADS (SERVICEABLE)
- 4 - WEAR PADS (SERVICEABLE)

REAR EXTENSION HOUSING

Inspect the extension housing seal and bushing. Replace both components if either show any sign of wear or damage.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Inspect the shaft splines and bearing surfaces. Minor nicks on the splines can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Replace the shaft if the bearing surfaces are scored or if any of the splines are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

J9021-16

Fig. 41 Low Range Annulus Gear

- 1 - FRONT CASE
- 2 - LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 41)

TRANSFER CASE - NV244 GENII (Continued)

FRONT AND REAR CASES

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil® stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

BEARINGS AND SEALS

80de58aa

Fig. 42 Remove Input Gear Bearing

- 1 - INPUT GEAR BEARING
- 2 - FRONT CASE

(1) Remove the input shaft bearing (Fig. 42) from the front case with suitable snap-ring pliers.

(2) Transfer the retaining ring to the new bearing if necessary and install the bearing into the front case.

(3) Remove the front output shaft bearing retaining ring from inside the front case half.

(4) Using Installer 6436 and Handle C-4171, remove front output shaft bearing.

(14) Insert magnet in front case pocket (Fig. 72).

TRANSFER CASE - NV244 GENII (Continued)

OIL PUMP AND REAR CASE

Lubricate the oil pump components with transmission fluid before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

8122e904

Fig. 73 Install Rear Case

- 1 - REAR CASE
2 - FRONT CASE

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft inner bearing race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly **MUST** be replaced.

(1) Install new o-ring in pickup tube inlet of oil pump, if necessary.

(2) Insert oil pickup tube into the oil pump.

(3) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

(4) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 73).

(5) Install rear output bearing snap-ring (Fig. 74) to output shaft.

(6) Install 4-5 rear case-to front case bolts (Fig. 75) to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail, and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are mis-aligned.

80de460b

SEAL BOOT AND SHIFT MOTOR ASSEMBLY

Fig. 76 Install Seal Boot

- 1 - SEAL BOOT
- 2 - SEAL SLINGER

- (1) Install a new seal boot clamp onto the seal boot.
- (2) Install the seal boot (Fig. 76) and clamp onto the slinger hub and tighten the clamp with Crimp Tool C-4975-A.

Fig. 77 Install the Shift Motor and Mode Sensor Assembly Bolts - Typical

- 1 - TRANSFER CASE
- 2 - SHIFT MOTOR AND MODE SENSOR ASSEMBLY
- 3 - BOLT

- (3) Position the shift motor and mode sensor assembly onto the transfer case.
- (4) Install the bolts (Fig. 77) to hold the shift motor and mode sensor assembly to the transfer case. Tighten the bolts to 16-25 N·m (12-18 ft. lbs.).

REAR EXTENSION

- (1) Install new seal in rear extension housing seal with Installer D-163 and Handle C-4171. Verify that the weep hole in the rubber is oriented downward.
- (2) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.

Fig. 78 Install Rear Extension Bolts

- 1 - EXTENSION HOUSING
- 2 - TRANSFER CASE

- (3) Align and install rear extension on retainer (Fig. 78).
- (4) Apply Mopar® Silicone Sealer to threads of rear extension housing bolts. Then install and tighten bolts to 16-24 N·m (12-18 ft. lbs.) torque.

INSTALLATION

- (1) Mount transfer case on a transmission jack.
- (2) Secure transfer case to jack with chains.
- (3) Position transfer case under vehicle.
- (4) Align transfer case and transmission shafts and install transfer case onto the transmission.
- (5) Install and tighten transfer case attaching nuts to 27-34 N·m (20-25 ft. lbs.) torque.
- (6) Connect the vent hose.
- (7) Connect the shift motor and mode sensor wiring connectors. Secure wire harness to clips on transfer case.
- (8) Align and connect the propeller shafts.
- (9) Fill transfer case with correct fluid. (Refer to 21 - TRANSMISSION/TRANSFER CASE/FLUID - STANDARD PROCEDURE)
- (10) Install skid plate, if equipped.
- (11) Remove transmission jack and support stand.
- (12) Lower vehicle and verify transfer case shift operation.

TRANSFER CASE - NV244 GENII (Continued)

EXTENSION HOUSING SEAL

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.

INSTALLATION

- (1) Clean fluid residue from sealing surface and inspect for defects.
- (2) Using Installer D-163, install seal in extension housing (Fig. 79).

80a4d332

Fig. 79 Install Rear Seal in Extension Housing

- 1 - SPECIAL TOOL C-4171
- 2 - SPECIAL TOOL D-163

- (3) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (4) Verify proper transfer case fluid level.
- (5) Lower vehicle.

FLUID

STANDARD PROCEDURE - FLUID DRAIN AND REFILL

The fill and drain plugs are both in the rear case (Fig. 80).

8122da35

Fig. 80 Fill/Drain Plug and I.D. Tag Location

- 1 - I.D. TAG
- 2 - FILL PLUG
- 3 - DRAIN PLUG

- (1) Raise vehicle.
- (2) Position drain pan under transfer case.
- (3) Remove drain and fill plugs and drain lubricant completely.
- (4) Install drain plug. Tighten plug to 20-34 N-m (15-25 ft. lbs.).
- (5) Remove drain pan.
- (6) Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, Automatic Transmission fluid.
- (7) Install and tighten fill plug to 20-34 N-m (15-25 ft. lbs.).
- (8) Lower vehicle.

FRONT OUTPUT SHAFT SEAL

REMOVAL

(1) Remove the front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL).

8122df4b

Fig. 81 Remove Boot Clamp

(3) Remove the front propeller shaft seal boot (Fig. 82).

FRONT OUTPUT SHAFT SEAL (Continued)

8122a7af

Fig. 83 Bend Slinger Upward

- 1 - SEAL SLINGER
2 - BEND UPWARD

(4) Remove the front output shaft seal slinger by bending (Fig. 83) the slinger away from the transfer case.

(5) Using a suitable pry tool, remove the slinger from the output shaft using care not to damage the shaft.

(6) Using a screw and a slide hammer, remove the front output shaft seal.

INSTALLATION

(1) Install the new front output shaft seal with Installer MB991168A

(2) Install the front output shaft seal slinger with Installer 8840. Install the slinger onto the shaft until the tool contacts the rear of the output shaft.

(3) Install a new seal boot clamp onto the seal boot.

(4) Install the seal boot and clamp onto the slinger hub and tighten the clamp with Crimp Tool C-4975-A.

(5) Install front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

MODE SENSOR**DESCRIPTION**

The transfer case mode sensor (Fig. 84) is an electronic device whose output can be interpreted to indicate the shift motor shaft's rotary position. The sensor consists of a magnetic ring and four Hall Effect Transistors to create a 4 channel digital device (non-contacting) whose output converts the motor shaft position into a coded signal. The TCCM must supply 5VDC (+/- 0.5v) to the sensor and monitor the shift motor position. The four channels are denoted A, B, C, and D. The sensor is mechanically linked to the shaft of the cam which causes the transfer case shifting. The mode sensor draws less than 53 mA.

MODE SENSOR (Continued)

OPERATION

During normal vehicle operation, the Transfer Case Control Module (TCCM) monitors the mode sensor outputs at least every 250 (+/-50) milliseconds when the shift motor is stationary and 400 microseconds when the shift motor is active. A mode sensor signal between 3.8 Volts and 0.8 Volts is considered to be undefined.

Refer to SECTOR ANGLES vs. TRANSFER CASE POSITION for the relative angles of the transfer case shift sector versus the interpreted transfer case gear operating mode. Refer to MODE SENSOR CHANNEL STATES for the sensor codes returned to the TCCM for each transfer case mode sensor position.

The various between gears positions can also be referred as the transfer case's coarse position. These coarse positions come into play during shift attempts.

SECTOR ANGLES VS. TRANSFER CASE POSITION

Shaft Angle (Degrees)	Transfer Case Position
+40	4LO
+20	N
0	2WD/AWD
-20	4HI

MODE SENSOR CHANNEL STATES

Transfer Case Angle (degrees)	Sensor Channel A	Sensor Channel B	Sensor Channel C	Sensor Channel D
Between Gears	H	H	L	H
+40 (4LO)	H	H	L	L
Between Gears	H	H	L	H
Between Gears	H	L	L	H
+20 (NEUTRAL)	H	L	L	L
Between Gears	H	L	L	H
Between Gears	H	L	H	H
0 (2WD/AWD)	H	L	H	L
Between Gears	H	L	H	H
Between Gears	L	L	H	H
-20 (4HI)	L	L	H	L
Between Gears	L	L	H	H
Between Gears	L	H	H	H

SELECTOR SWITCH

DESCRIPTION

The selector switch assembly is mounted in the left side of the vehicle's Instrument Panel (IP) and consists of a rotary knob connected to a resistive network for the mode and range shift selections. Also located in this assembly is a recessed, normally open momentary switch for making shifts into and out of transfer case NEUTRAL. A pen, or similar instrument, is used to make a NEUTRAL shift selection, thus reducing the likelihood of an inadvertent shift request.

The selector switch also contains light emitting diode's (LED's) to indicate the transfer case position and whether a shift is in progress.

SELECTOR SWITCH (Continued)

OPERATION

As the position of the selector switch varies, the resistance between the Mode Sensor supply voltage pin and the Mode Sensor output will vary. Hardware, software, and calibrations within the Transfer Case Control Module (TCCM) are provided that interpret the selector switch resistance as given in the table below: SELECTOR SWITCH INTERPRETATION

SELECTOR SWITCH INTERPRETATION

Step	Resistance Range (ohms)	Required Interpretation
A	<200	Shorted
B	400-700	NEUTRAL
C	1050-1450	4LO
D	1850-2300	4H
E	3050-5950	AWD (Default)
F	9.5-12.5K	In between positions
G	>15.5K	Open

For resistances between the ranges B-E shown for each valid position (T-Case NEUTRAL, 4LO, 4HI, AWD), the TCCM may interpret the resistance as:

- either of the neighboring valid positions.
- as an invalid fault position.

For resistances between the ranges E and F shown for AWD and in-between positions, the TCCM may interpret the resistance as:

- the AWD position.
- an invalid fault position.
- a valid in-between position.

For resistances between the ranges F and G shown for in-between positions and fault condition (open), the TCCM may interpret the resistance as:

- a valid in-between position.
- an invalid fault position.

For resistances between the ranges A and B shown for the fault condition (short) and , T-Case NEUTRAL, the TCCM may interpret the resistance as:

- the T-Case NEUTRAL position.
- an invalid fault position.

The LED's in the selector assembly are illuminated/flushed in the following manner to indicate a particular condition or state.

- A solidly illuminated LED indicates a successfully completed shift and the current operating mode of the transfer case. While a shift has been requested but not yet completed, the LED for the desired transfer case position is flashed.

- A flashing operating mode LED for the desired gear indicates that a shift to that position has been requested, but all of the driver controllable conditions have not been met. This is in an attempt to notify the driver that the transmission needs to be put into NEUTRAL, the vehicle speed is too great, or some other condition outlined (other than a diagnostic failure that would prevent this shift) elsewhere (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - OPERATION) is not met. Note that this flashing will continue indefinitely until the conditions are eventually met, or the selector switch position is changed, or if diagnostic routines no longer allow the requested shift.

- If the driver attempts to make a shift into transfer case NEUTRAL, and any of the driver controllable conditions are not met, the request will be ignored until all of the conditions are met or until the NEUTRAL select button is released. Additionally the neutral lamp will flash, or begin to flash while the button is depressed and operator controllable conditions are not being met. All of the LED's except the Neutral will flash if any of the operator controllable conditions for shifting are not met while the Neutral button is depressed. This "toggle" type of feature is necessary because the TCCM would interpret another request immediately after the shift into transfer case NEUTRAL has completed.

- No LED's illuminated indicate a fault in the transfer case control system.

SHIFT MOTOR

DESCRIPTION

The shift motor (Fig. 85) consists of a permanent magnet D.C. motor with gear reduction to convert a high speed-low torque device into a low speed-high torque device. The output of the device is coupled to a shaft which internally moves the mode and range forks that change the transfer case operating ranges. The motor is rated at 25 amps maximum at 72° F with 10 volts at the motor leads.

80ac0e3e

Fig. 85 Shift Motor - Shown Inverted - Typical

1 - SHIFT MOTOR

OPERATION

The transfer case shift motor responds to the Transfer Case Control Module (TCCM) commands to move the transfer case shift sector bi-directionally, as required, to obtain the transfer case operating mode indicated by the instrument panel mounted selector switch.

REMOVAL

NOTE: New shift motor assemblies are shipped in the 2WD/AWD position. If a new shift motor assembly will be installed, it will be necessary to shift the transfer case to the 2WD/AWD position prior to motor removal.

- (1) Raise the vehicle on a suitable hoist.
- (2) Disengage the wiring connectors from the shift motor and mode sensor.
- (3) Remove the bolts holding the shift motor and mode sensor assembly onto the transfer case.
- (4) Separate the shift motor and mode sensor assembly from the transfer case.

INSTALLATION

- (1) Verify that the shift sector o-ring is clean and properly positioned over the shift sector and against the transfer case.

NOTE: Verify that the shift motor position and sector shaft orientation are aligned. It may be necessary to manually shift the transfer case if the shift motor and sector shaft are not aligned.

- (2) Position the shift motor and mode sensor assembly onto the transfer case.
- (3) Install the bolts to hold the assembly onto the transfer case. Tighten the bolts to 16-24 N·m (12-18 ft.lbs.).

CAUTION: If the original shift motor and mode sensor assembly bolts are reused, be sure to use Mopar® Lock & Seal or Loctite™ 242 to replenish the lock patch material originally found on the bolts

- (4) Engage the wiring connectors to the shift motor and mode sensor.
- (5) Refill the transfer case as necessary.
- (6) Lower vehicle and verify transfer case operation.

TRANSFER CASE - NV273

DESCRIPTION

The NV273 is an electronically controlled part-time transfer case with a low range gear reduction system. The NV273 has three operating ranges plus a NEUTRAL position. The low range system provides a gear reduction ratio for increased low speed torque capability.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum case halves.

OPERATING RANGES

Transfer case operating ranges are:

- 2WD (2-wheel drive)
- 4HI (4-wheel drive)
- 4LO (4-wheel drive low range)
- NEUTRAL

The 2WD range is for use on any road surface at any time.

The 4HI and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is wet or slippery or covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

SHIFT MECHANISM

Operating ranges are selected with a dash mounted shift selector switch. The shift selector switch provides a input to the Transfer Case Control Module (TCCM) to indicate the driver's desire to change operating ranges. The TCCM uses this input, along with input from the transfer case mounted mode sensor and information from the vehicle's bus, to determine if a shift is permitted. If the TCCM decides the shift is permitted, the TCCM controls the shift motor, mounted to the exterior of the transfer case, to perform the shift.

TRANSFER CASE - NV273 (Continued)

IDENTIFICATION

A circular ID tag is attached to the rear case of each transfer case (Fig. 1). The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the planetary assembly and range sleeve. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is engaged/disengaged by the mode fork, which operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchronizer mechanism for shifting.

DIAGNOSIS AND TESTING - TRANSFER CASE - NV273

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case electronically controlled shift system malfunction.	1) Verify proper operation per the appropriate diagnostic manual.
	2) If vehicle was operated for an extended period in 4HI mode on dry surface, driveline torque load may cause difficulty.	2) Drive the vehicle in a straight line and momentarily release the accelerator. The transfer case can then be shifted to the desired mode.
	3) Insufficient or incorrect lubricant.	3) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	4) Internal transfer case components binding, worn, or damaged.	4) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, type 9602, Automatic Transmission Fluid.
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.

TRANSFER CASE - NV273 (Continued)

Condition	Possible Cause	Correction
Transfer case noisy while in, or jumps out of, 4LO mode.	1) Transfer case not completely engaged in 4LO position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL, or clutch depressed on vehicles equipped with a manual transmission, shift transfer case to the 2WD or 4HI position, and then back into the 4LO position.
	2) Range fork damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Abnormal tire wear.	1) Extended operation in 4HI mode on dry surfaces,	1) Operate vehicle in 2WD mode on dry surfaces.

REMOVAL

- (1) Shift transfer case into 2WD.
- (2) Raise vehicle.
- (3) Drain transfer case lubricant.
- (4) Mark front and rear propeller shafts for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove the transfer case skid plate, if equipped.
- (7) Disconnect front and rear propeller shafts at transfer case.
- (8) Disconnect transfer case shift motor and mode sensor wire connectors.
- (9) Disconnect transfer case vent hose.
- (10) Support transfer case with transmission jack.
- (11) Secure transfer case to jack with chains.
- (12) Remove nuts attaching transfer case to transmission (Fig. 2).
- (13) Pull transfer case and jack rearward to disengage transfer case.
- (14) Remove transfer case from under vehicle.

80de7845

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

TRANSFER CASE - NV273 (Continued)

COMPANION FLANGE AND EXTENSION HOUSING

- (1) Install two bolts 180° apart into the front output shaft companion flange.
- (2) Place holder over the bolts and against the companion flange (Fig. 3).
- (3) Remove and discard the front companion flange nut.
- (4) Remove the companion flange from the front output shaft. It may be necessary to use Flange puller 8992 to remove the companion flange.

80ff4db0

OIL PUMP AND REAR CASE

(1) Disengage the oil pump pick-up tube (Fig. 7) from the oil pump.

NOTE: The oil pump pick-up tube seals to the oil pump with an o-ring. Verify that the o-ring was removed with the tube and is in good condition. Replace the o-ring if necessary.

80ff4e62

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 39). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. Check the pinion gear thrust washers on the pinon pins for damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 40). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

80b49eaf

Fig. 40 Shift Forks

- 1 - RANGE FORK
- 2 - MODE FORK AND RAIL
- 3 - MODE SPRING

Inspect the shift fork wear pads (Fig. 41). The mode and range fork pads are serviceable and can be replaced if necessary.

80b49eb4

Fig. 41 Shift Fork And Wear Pad Locations

- 1 - RANGE FORK
- 2 - MODE FORK
- 3 - WEAR PADS (SERVICEABLE)
- 4 - WEAR PADS (SERVICEABLE)

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

REAR EXTENSION HOUSING

Inspect the extension housing seal and bushing. Replace both components if either show any sign of wear or damage.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Inspect the shaft threads, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the threads are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 42)

J9021-16

Fig. 42 Low Range Annulus Gear

- 1 - FRONT CASE
- 2 - LOW RANGE ANNULUS GEAR

FRONT AND REAR CASES

Inspect the cases for wear and damage. Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

TRANSFER CASE - NV273 (Continued)

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil® stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

BEARINGS AND SEALS

- (1) Remove the input shaft bearing snap-ring from the front case half with suitable snap-ring pliers.
- (2) Remove the input shaft bearing from the front case half with Installer 6953 and Handle C-4171 (Fig. 43).
- (3) Install the input shaft bearing into the front case half with Installer 8151 inverted on Handle C-4171 (Fig. 44).
- (4) Install the input shaft bearing snap-ring into the front case half with suitable snap-ring pliers.

80ff8629

- (10) Insert magnet in front case pocket (Fig. 79).

Fig. 79 Case Magnet Installation

- 1 - MAGNET
- 2 - CASE POCKET

REAR CASE

- (1) Install the oil pick-up tube and screen into the rear case half.

- (2) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

- (3) Align mainshaft with the rear output shaft bearing and align shift rail with bore in rear case. Then install rear case (Fig. 80). Verify that the case alignment dowels correctly seat into their mating recesses.

Fig. 80 Install Rear Case Half

- 1 - FRONT CASE HALF
- 2 - REAR CASE HALF

TRANSFER CASE - NV273 (Continued)

(4) Install 4-5 rear case-to-front case bolts (Fig. 81) to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail, and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

(5) Tighten bolts to 27-34 N·m (20-25 ft. lbs.),
 (6) Install rear output bearing inner snap-ring (Fig. 82) to output shaft.

Fig. 81 Install Case Half Bolts

TRANSFER CASE - NV273 (Continued)

(7) Install the front companion flange onto the front output shaft.

(8) Install two bolts 180° apart into the front output shaft companion flange.

(9) Place holder over the bolts and against the companion flange (Fig. 88).

(10) Install a new front companion flange nut. Tighten the companion flange nut to 176-271 N·m (130-200 ft.lbs.).

INSTALLATION

- (1) Mount transfer case on a transmission jack.
- (2) Secure transfer case to jack with chains.
- (3) Position transfer case under vehicle.
- (4) Align transfer case and transmission shafts and install transfer case onto the transmission.
- (5) Install and tighten transfer case attaching nuts to 27-34 N·m (20-25 ft. lbs.) torque.
- (6) Connect the vent hose.
- (7) Connect the shift motor and mode sensor wiring connectors. Secure wire harness to clips on transfer case.
- (8) Align and connect the propeller shafts.
- (9) Fill transfer case with correct fluid. (Refer to 21 - TRANSMISSION/TRANSFER CASE/FLUID - STANDARD PROCEDURE)
- (10) Install skid plate, if equipped.

80ff4cb0

Fig. 88 Install Companion Flange Nut

- 1 - HOLDER 6719
2 - BOLTS

- (11) Remove transmission jack and support stand.
- (12) Lower vehicle and verify transfer case shift operation.

EXTENSION HOUSING SEAL AND DUST BOOT

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Use a suitable chisel or pry tool to remove the rear extension housing dust boot (Fig. 89).
- (4) Use a suitable chisel or pry tool to remove the rear extension housing seal.

Fig. 89 Remove Extension Housing Dust Boot

- 1 - EXTENSION HOUSING
- 2 - DUST BOOT

INSTALLATION

- (1) Clean fluid residue from sealing surface and inspect for defects.
- (2) Install the extension housing dust boot and seal assembly with Installer 9037 and Handle C-4171 (Fig. 90).
- (3) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (4) Verify proper transfer case fluid level.
- (5) Lower vehicle.

FLUID

STANDARD PROCEDURE - FLUID DRAIN AND REFILL

The fill and drain plugs are both in the rear case (Fig. 91).

- (1) Raise vehicle.

Fig. 90 Install Extension Housing Seal

- 1 - EXTENSION HOUSING
- 2 - HANDLE C-4171
- 3 - INSTALLER 9037

Fig. 91 Drain and Fill Locations

- 1 - FILL HOLE
- 2 - DRAIN HOLE

- (2) Position drain pan under transfer case.
- (3) Remove drain and fill plugs and drain lubricant completely.
- (4) Install drain plug. Tighten plug to 41-54 N-m (30-40 ft. lbs.).
- (5) Remove drain pan.

FLUID (Continued)

(6) Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, Automatic Transmission fluid.

(7) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.).

(8) Lower vehicle.

FRONT OUTPUT SHAFT SEAL

REMOVAL

(1) Remove the front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL).

(2) Install two bolts 180° apart into the front output shaft companion flange.

(3) Place holder over the bolts and against the companion flange (Fig. 92).

(4) Remove and discard the front companion flange nut.

(5) Remove the companion flange from the front output shaft. It may be necessary to use Flange puller 8992 to remove the companion flange.

80ff4cb0

Fig. 92 Remove Companion Flange Nut

1 - HOLDER 6719
2 - BOLTS

(6) Using a screw and a slide hammer, remove the front output shaft seal.

INSTALLATION

(1) Install the new front output shaft seal with Installer MB991168A.

(2) Install the front companion flange onto the front output shaft.

(3) Install two bolts 180° apart into the front output shaft companion flange.

(4) Place holder over the bolts and against the companion flange (Fig. 93).

(5) Install a new front companion flange nut. Tighten the companion flange nut to 258-312 N·m (190-230 ft.lbs.).

80ff4cb0

Fig. 93 Install Companion Flange Nut

1 - HOLDER 6719
2 - BOLTS

(6) Install front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

MODE SENSOR

DESCRIPTION

The transfer case mode sensor (Fig. 94) is an electronic device whose output can be interpreted to indicate the shift motor shaft's rotary position. The sensor consists of a magnetic ring and four Hall Effect Transistors to create a 4 channel digital device (non-contacting) whose output converts the motor shaft position into a coded signal. The TCCM must supply 5VDC (+/- 0.5v) to the sensor and monitor the shift motor position. The four channels are denoted A, B, C, and D. The sensor is mechanically linked to the shaft of the cam which causes the transfer case shifting. The mode sensor draws less than 53 mA.

OPERATION

During normal vehicle operation, the Transfer Case Control Module (TCCM) monitors the mode sensor outputs at least every 250 (+/-50) milliseconds when the shift motor is stationary and 400 microseconds when the shift motor is active. A mode sensor signal between 3.8 Volts and 0.8 Volts is considered to be undefined.

Refer to SECTOR ANGLES vs. TRANSFER CASE POSITION for the relative angles of the transfer case shift sector versus the interpreted transfer case gear operating mode. Refer to MODE SENSOR CHANNEL STATES for the sensor codes returned to the TCCM for each transfer case mode sensor position. The various between gears positions can also be referred as the transfer case's coarse position. These coarse positions come into play during shift attempts.

Fig. 94 Mode Sensor

1 - MODE SENSOR

SECTOR ANGLES VS. TRANSFER CASE POSITION

Shaft Angle (Degrees)	Transfer Case Position
+40	4LO
+20	N
0	2WD/AWD

SELECTOR SWITCH

DESCRIPTION

The selector switch assembly (Fig. 95) is mounted in the left side of the vehicle's Instrument Panel (IP) and consists of a rotary knob connected to a resistive network for the mode and range shift selections. Also located in this assembly is a recessed, normally open momentary switch for making shifts into and out of transfer case NEUTRAL. A pen, or similar instrument, is used to make a NEUTRAL shift selection, thus reducing the likelihood of an inadvertent shift request.

The selector switch also contains four light emitting diode's (LED's) to indicate the transfer case position and whether a shift is in progress.

TRANSFER CASE SELECTOR SWITCH

80da1af4

Fig. 95 Transfer Case Selector Switch

1 - SELECTOR SWITCH

OPERATION

As the position of the selector switch varies, the resistance between the Mode Sensor supply voltage pin and the Mode Sensor output will vary. Hardware, software, and calibrations within the Transfer Case Control Module (TCCM) are provided that interpret the selector switch resistance as given in the table below: SELECTOR SWITCH INTERPRETATION

SELECTOR SWITCH INTERPRETATION

Step	Resistance Range (ohms)	Required Interpretation
A	<200	Shorted
B	400-700	NEUTRAL
C	1050-1450	4LO
D	1850-2300	4HI
E	3050-5950	2WD (Default)
F	9.5-12.5K	In between positions
G	>15.5K	Open

For resistances between the ranges B-E shown for each valid position (T-Case NEUTRAL, 4LO, 4HI, 2WD), the TCCM may interpret the resistance as:

- either of the neighboring valid positions.
- as an invalid fault position.

For resistances between the ranges E and F shown for 2WD and in-between positions, the TCCM may interpret the resistance as:

- the 2WD position.
- an invalid fault position.
- a valid in-between position.

For resistances between the ranges F and G shown for in-between positions and fault condition (open), the TCCM may interpret the resistance as:

- a valid in-between position.
- an invalid fault position.

For resistances between the ranges A and B shown for the fault condition (short) and , T-Case NEUTRAL, the TCCM may interpret the resistance as:

- the T-Case NEUTRAL position.
- an invalid fault position.

The LED's in the selector assembly are illuminated/flashed in the following manner to indicate a particular condition or state.

- A solidly illuminated LED indicates a successfully completed shift and the current operating mode of the transfer case. While a shift has been requested but not yet completed, the LED for the desired transfer case position is flashed.

- A flashing operating mode LED for the desired gear indicates that a shift to that position has been requested, but all of the driver controllable conditions

SELECTOR SWITCH (Continued)

have not been met. This is in an attempt to notify the driver that the transmission needs to be put into NEUTRAL, the vehicle speed is too great, or some other condition outlined (other than a diagnostic failure that would prevent this shift) elsewhere (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - OPERATION) is not met. Note that this flashing will continue indefinitely until the conditions are eventually met, or the selector switch position is changed, or if diagnostic routines no longer allow the requested shift.

- If the driver attempts to make a shift into transfer case NEUTRAL, and any of the driver controllable conditions are not met, the request will be ignored until all of the conditions are met or until the NEUTRAL select button is released. Additionally the neutral lamp will flash, or begin to flash while the button is depressed and operator controllable conditions are not being met. All of the LED's except the Neutral will flash if any of the operator controllable conditions for shifting are not met while the Neutral button is depressed. This "toggle" type of feature is necessary because the TCCM would interpret another request immediately after the shift into transfer case NEUTRAL has completed.

- No LED's illuminated indicate a fault in the transfer case control system.

SHIFT MOTOR

DESCRIPTION

The shift motor (Fig. 96) consists of a permanent magnet D.C. motor with gear reduction to convert a high speed-low torque device into a low speed-high torque device. The output of the device is coupled to a shaft which internally moves the mode and range forks that change the transfer case operating ranges. The motor is rated at 25 amps maximum at 72° F with 10 volts at the motor leads.

OPERATION

The transfer case shift motor responds to the Transfer Case Control Module (TCCM) commands to move the transfer case shift sector bi-directionally, as required, to obtain the transfer case operating mode indicated by the instrument panel mounted selector switch.

REMOVAL

NOTE: New shift motor assemblies are shipped in the 2WD/AWD position. If a new shift motor assembly will be installed, it will be necessary to shift the transfer case to the 2WD/AWD position prior to motor removal.

80ac0e3e

Fig. 96 Shift Motor - Shown Inverted - Typical

1 - SHIFT MOTOR

- (1) Raise the vehicle on a suitable hoist.
- (2) Disengage the wiring connectors from the shift motor and mode sensor.
- (3) Remove the bolts holding the shift motor and mode sensor assembly onto the transfer case.
- (4) Separate the shift motor and mode sensor assembly from the transfer case.

INSTALLATION

- (1) Verify that the shift sector o-ring is clean and properly positioned over the shift sector and against the transfer case.

NOTE: Verify that the shift motor position and sector shaft orientation are aligned. It may be necessary to manually shift the transfer case if the shift motor and sector shaft are not aligned.

- (2) Position the shift motor and mode sensor assembly onto the transfer case.
- (3) Install the bolts to hold the assembly onto the transfer case. Tighten the bolts to 16-24 N·m (12-18 ft.lbs.).

CAUTION: If the original shift motor and mode sensor assembly bolts are reused, be sure to use Mopar® Lock & Seal or Loctite™ 242 to replenish the lock patch material originally found on the bolts

- (4) Engage the wiring connectors to the shift motor and mode sensor.
- (5) Refill the transfer case as necessary.
- (6) Lower vehicle and verify transfer case operation.

TIRES/WHEELS

DIAGNOSIS AND TESTING - TIRE AND WHEEL RUNOUT

Radial runout is the difference between the high and low points on the tire or wheel (Fig. 1).

Lateral runout is the **wobble** of the tire or wheel.

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

TIRES/WHEELS (Continued)

I9022-4

Fig. 1 Checking Tire/Wheel/Hub Runout

- 1 - RADIAL RUNOUT
- 2 - LATERAL RUNOUT

METHOD 1 (RELOCATE WHEEL ON HUB)

- (1) Drive vehicle a short distance to eliminate tire flat spotting from a parked position.
- (2) Check wheel bearings and adjust if adjustable or replace if necessary.
- (3) Check the wheel mounting surface.
- (4) Relocate wheel on the mounting, two studs over from the original position.
- (5) Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.
- (6) Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

METHOD 2 (RELOCATE TIRE ON WHEEL)

NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

- (1) Remove tire from wheel and mount wheel on service dynamic balance machine.
- (2) Check wheel radial runout (Fig. 2) and lateral runout (Fig. 3).
 - STEEL WHEELS: Radial runout 0.031 in., Lateral runout 0.031 in. (maximum)
 - ALUMINUM WHEELS: Radial runout 0.020 in., Lateral runout 0.025 in. (maximum)
- (3) If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout, Refer to match mounting procedure.

TIRES/WHEELS (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE ROTATION

Tires on the front and rear axles operate at different loads and perform different steering, driving, and braking functions. For these reasons, the tires wear at unequal rates. They may also develop irregular wear patterns. These effects can be reduced by rotating the tires according to the maintenance schedule in the Owners Manual. This will improve tread life, traction and maintain a smooth quiet ride.

The recommended method of tire rotation is (Fig. 4) & (Fig. 5). Other methods can be used, but may not provide the same tire longevity benefits.

8031e864

Fig. 4 TIRE ROTATION PATTERN - SINGLE REAR WHEEL (SRW)

CAUTION: 3500 Dual rear tires have a new tire rotation pattern. This is to accommodate the asymmetrical design of the ON/OFF road tires and the use of the outlined white letter (OWL) tires. When replacing a flat, the spare tire may have to be remounted on the rim or installed at a different location to maintain the correct placement of the asymmetrical design or the (OWL).

80f58ec6

Fig. 5 TIRE ROTATION PATTERN - DUAL REAR WHEELS (DRW)

STANDARD PROCEDURE - MATCH MOUNTING

Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. Each are marked with a bright colored temporary label on the out-board surface for alignment. The wheel is also marked permanently on the inside of the rim in the tire well. This permanent mark may be a paint dot or line, a permanent label or a stamped impression such as an X. An optional location mark is a small spherical indentation on the vertical face of the out-board flange on some non styled base steel wheels. The tire must be removed to locate the permanent mark on the inside of the wheel.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

(1) Remove the tire and wheel assembly from the vehicle and mount on a service dynamic balance machine.

(2) Measure the total runout on the center of the tire tread rib with a dial indicator. Record the indicator reading. Mark the tire to indicate the high spot. Place a mark on the tire at the valve stem location (Fig. 6).

J9322-3

Fig. 6 First Measurement On Tire

- 1 - REFERENCE MARK
- 2 - 1ST MEASUREMENT HIGH SPOT MARK TIRE AND RIM
- 3 - WHEEL
- 4 - VALVE STEM

TIRES/WHEELS (Continued)

(3) Break down the tire and remount it 180 degrees on the rim (Fig. 7).

J9322-4

Fig. 7 Remount Tire 180 Degrees

- 1 - VALVE STEM
2 - REFERENCE MARK

(4) Measure the total indicator runout again. Mark the tire to indicate the high spot.

(5) If runout is still excessive, the following procedures must be done.

- If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.
- If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications. Refer to Wheel and Tire Runout.
- If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot to first. Break down the tire and remount it 90 degrees on rim in that direction (Fig. 8). This procedure will normally reduce the runout to an acceptable amount, if not replace the rim.

STANDARD PROCEDURE - TIRE AND WHEEL BALANCE

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

J9322-5

Fig. 8 Remount Tire 90 Degrees In Direction of Arrow

- 1 - 2ND HIGH SPOT ON TIRE
2 - 1ST HIGH SPOT ON TIRE

NOTE: Static should be used only when a two plane balancer is not available.

NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

For static balancing, find the location of the heavy spot causing the imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 9).

For dynamic balancing, the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (Fig. 10).

TIRES

DESCRIPTION

DESCRIPTION - SPARE TIRE / TEMPORARY

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

DESCRIPTION - TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation, (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE). This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code (Fig. 11).

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 100 mph
- **R** up to 106 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S**, **M & S** or **M-S** (indicating mud and snow traction) imprinted on the side wall.

Fig. 11 Tire Identification

TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

DESCRIPTION - RADIAL - PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 50 MPH is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is **NOT** recommended. The proper tire pressure should be maintained on all four tires.

TIRES (Continued)

DESCRIPTION - TIRE PRESSURE FOR HIGH SPEEDS

For proper tire pressure specification refer to the Owners Manual.

DESCRIPTION - REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

DESCRIPTION - TIRE INFLATION PRESSURES

Under inflation will cause rapid shoulder wear, tire flexing, and possible tire failure (Fig. 12).

Fig. 12 Under Inflation Wear

1 - THIN TIRE THREAD AREAS

Over inflation will cause rapid center wear and loss of the tire's ability to cushion shocks (Fig. 13).

Fig. 13 Over Inflation Wear

1 - THIN TIRE THREAD AREA

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification refer to the vehicles Owners Manual.

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND TREAD WEAR. THIS MAY CAUSE THE TIRE TO FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - PRESSURE GAUGES**

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

DIAGNOSIS AND TESTING - TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

TIRES (Continued)

DIAGNOSIS AND TESTING - TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 14).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

18922-5

Fig. 14 Tread Wear Indicators

- 1 - TREAD ACCEPTABLE
- 2 - TREAD UNACCEPTABLE
- 3 - WEAR INDICATOR

DIAGNOSIS AND TESTING - TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 15).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 15).

DIAGNOSIS AND TESTING - TIRE/VEHICLE LEAD

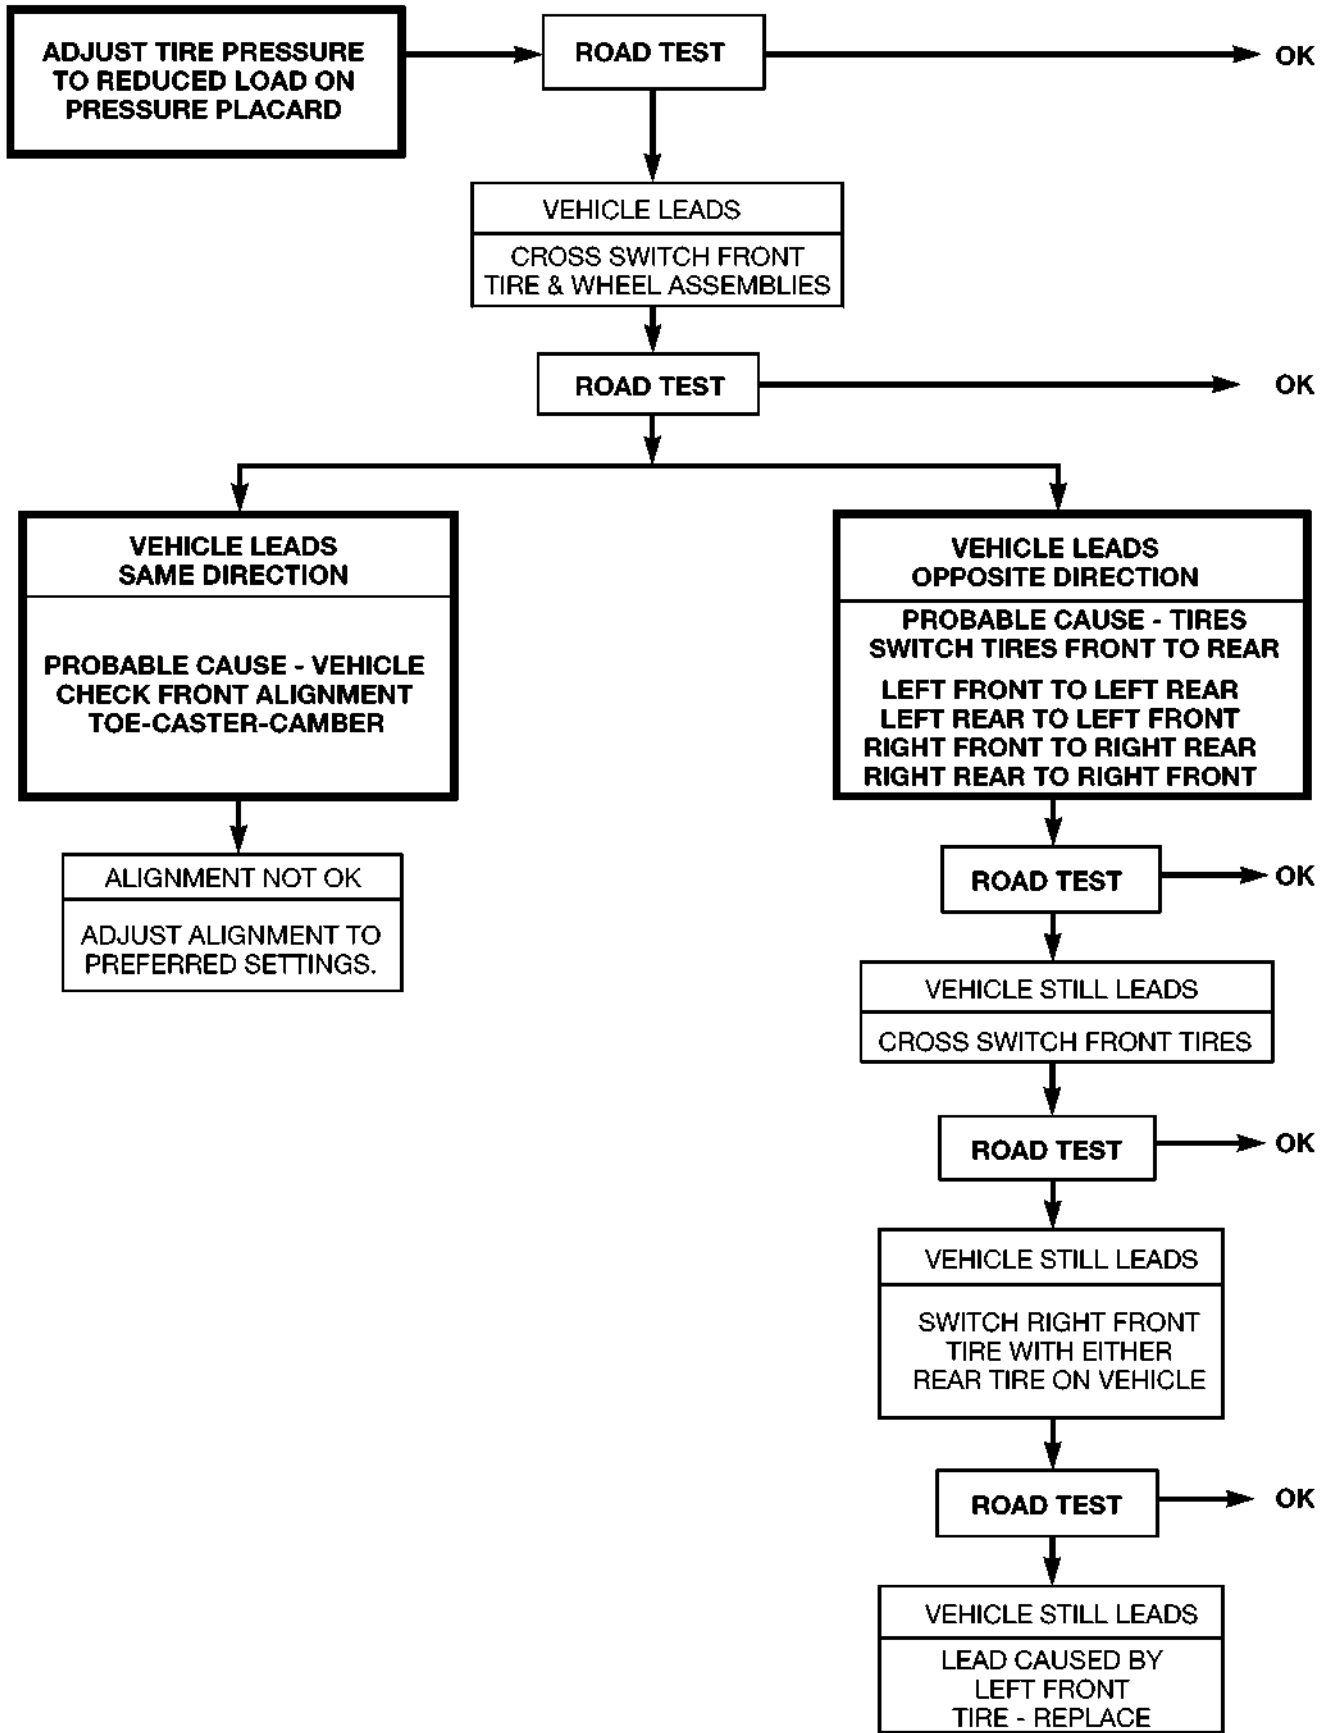

Use the following Vehicle Lead Diagnosis And Correction Chart to diagnose and correct a vehicle lead or drift problem (Fig. 16).

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT							
CAUSE	UNDER-INFLATION OR LACK OF ROTATION 	OVER-INFLATION OR LACK OF ROTATION 	UNDER-INFLATION OR EXCESSIVE SPEED*	EXCESSIVE CAMBER 	INCORRECT TOE 	UNBALANCED WHEEL 	LACK OF ROTATION OF TIRES OR WORN OR OUT-OF-ALIGNMENT SUSPENSION.

*HAVE TIRE INSPECTED FOR FURTHER USE.

Fig. 15 Tire Wear Patterns

TIRES (Continued)

80a53b5b

Fig. 16 VEHICLE LEAD DIAGNOSIS AND CORRECTION CHART

TIRES (Continued)

STANDARD PROCEDURE - REPAIRING LEAKS

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 17). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification, (Refer to 22 - TIRES/WHEELS/WHEELS - SPECIFICATIONS).

WHEELS

DESCRIPTION

Original equipment wheels are designed for the specified Maximum Vehicle Capacity.

All models use steel or aluminum drop center wheels.

Aluminum wheels require special balance weights and alignment equipment.

(1) On vehicles equipped with dual rear wheels, The rim is an eight stud hole pattern wheel. The wheels have a flat mounting surface (Fig. 18). The slots in the wheel must be aligned to provide access to the valve stem (Fig. 19).

80f58f0a

Fig. 18 FLAT FACE WHEEL

- 2 - INBOARD VALVE STEM
- 3 - OUTBOARD VALVE STEM

OPERATION

The wheel (Fig. 20) has raised sections between the rim flanges and the rim well. Initial inflation of the tire forces the bead over these raised sections. In case of tire failure, the raised sections hold the tire in position on the wheel until the vehicle can be brought to a safe stop.

J9022-3

Fig. 20 Safety Rim

- 2 - RIDGE
- 3 - WELL

DIAGNOSIS AND TESTING

WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

WHEELS (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURE - WHEEL REPLACEMENT

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts (Fig. 21). This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface (Fig. 21). All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification, (Fig. 22) (Fig. 23). **Never use oil or grease on studs or nuts.**

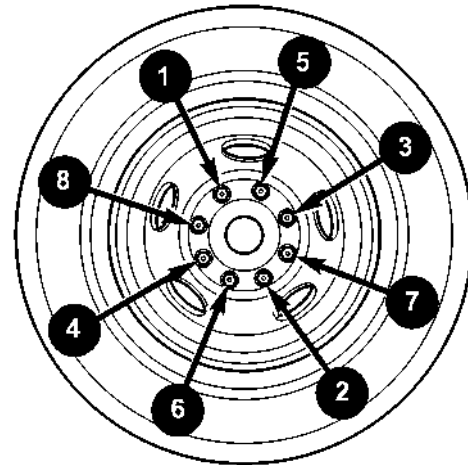

Fig. 21 WHEEL INSTALLATION 8-LUG SHOWN

- 1 - CENTER CAP
2 - LUG NUT
3 - TIRE/WHEEL ASSEMBLY
4 - WHEEL STUDS

Wheels must be replaced if they have:

- Excessive runout
- Bent or dented
- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

80f59017

Fig. 22 8-LUG TIGHTENING PATTERN

806a32cd

Fig. 23 TYPICAL 6 - LUG NUT TIGHTENING PATTERN

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

STANDARD PROCEDURE - DUAL REAR WHEEL INSTALLATION

Dual rear wheels use a special heavy duty lug nut wrench. It is recommended to remove and install dual rear wheels only when the proper wrench is available. The wrench is also use to remove wheel

WHEELS (Continued)

center caps for more information refer to Owner's Manual.

The tires on both wheels must be completely raised off the ground when tightening the lug nuts. This will ensure correct wheel centering and maximum wheel clamping.

A two piece flat face lug nut with right-hand threads is used for retaining the wheels on the hubs (Fig. 24).

The dual rear wheel lug nuts should be tightened according to the following procedure:

- Place two drops of oil to the interface of the nut/washer (Fig. 24) before installing on the wheel stud.

NOTE: Do not use more than two drops of oil on the nut/washer, since the center caps attach in this area.

- Tighten the wheel lug nuts in the numbered sequential pattern until they are snug tight. Then tighten lug nut to specified torque following same number sequence, (Refer to 22 - TIRES/WHEELS/WHEELS - SPECIFICATIONS).

- Tighten lug nuts in same numbered sequence a second time to the specified torque. This will ensure that the wheels are thoroughly mated.

SPECIFICATIONS

TORQUE CHART

TORQUE SPECIFICATIONS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
1500 Series Lug Nut 9/16 X 18 with 60° Cone	180	135	—

80a41019

Fig. 24 Oil Location

1 - PLACE TWO DROPS OF OIL HERE

- Check lug nut specified torque after 100 miles (160 kilometers). Also after 500 miles (800 kilometers) of vehicle operation.

NOTE: Wheel lug nuts should be tightened to specified torque at every maintenance interval thereafter.

STUDS

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the wheel and tire assembly.
- (3) Remove the brake caliper, caliper adapter and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
- (4) Remove the stud from the hub with Remover C-4150A (Fig. 25).

Fig. 25 Wheel Stud Removal

- 1 - REMOVER
2 - WHEEL STUD

INSTALLATION

- (1) Install the new stud into the hub flange.
- (2) Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
- (3) Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
- (4) Remove the lug nut and washers.
- (5) Install the brake rotor, caliper adapter, and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
- (6) Install the wheel and tire assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE), use new the lug nut on stud or studs that were replaced.
- (7) Remove the support and lower vehicle.

WHEEL COVER

REMOVAL

NOTE: The hub caps must be removed before raising the vehicle off the ground.

NOTE: You must use the flat end of the hub/cap remover/installer combination tool to pry off the wheel skins. Insert the flat tip completely and using a back and forth motion, loosen the wheel skin. repeat this procedure around the tire until the wheel skin pops off.

(1) On 2500/3500 single rear wheel (SRW) models, insert a hub/cap remover/installer combination tool using the blade on the end of the tool to pry the cap off in a back and forth motion.

(2) On 3500 models with dual rear wheels (DRW), you must first remove the hub caps. The hub/cap remover/installer combination tool must be inserted in the pry off notch of the rear hub caps.

(3) Position the hub/cap remover/installer combination tool and pull out on the tool firmly. The cap should come off.

(4) The wheel skins can now be removed from the wheel.

(5) On 3500 models front hub caps use the hub/cap remover/installer combination tool to pry off the cap in a back and forth motion. The wheel skins can now be removed.

INSTALLATION

INSTALLATION - REAR

(1) Install one 1 1/2 in. valve stem extension on each rear inner wheel.

NOTE: A 3/8 in. drive 10mm deep wheel socket with a 10 in. or greater extension can be used to remove the existing valve stem cap and install the extension.

(2) Install one 1 in. valve stem extension on each outer wheel.

(3) Align the cooling windows of the wheel skin with the cooling windows of the wheel. Seat one side of the wheel skin's retainer onto the wheel. Using a rubber mallet, strike the wheel skin on the outer circumference. Strike at several locations around the circumference until the skin is fully seated.

NOTE: The wheel skin and the hub cap are fully seated when there is a consistent gap between the skin/cap and the wheel.

(4) Tug on the hub/cap wheel skin to ensure that they are properly installed.

INSTALLATION - FRONT

(1) Align the valve stem with the notch in the wheel skin.

WHEEL COVER (Continued)

- (2) Seat on side of the wheel skin's wire retainer on to the wheel.
- (3) Using a rubber mallet, strike the opposite side of the wheel skin until the skin is properly seated.

NOTE: The wheel skin and the hub cap are fully seated when there is a consistent gap between the skin/ cap and the wheel.

- (4) Tug on the hub cap/wheel skin to ensure that they are properly installed.

SPARE TIRE

DESCRIPTION

DESCRIPTION - SPARE / TEMPORARY TIRE

The temporary spare tire is designed for emergency use only. The original tire should be repaired

or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

DESCRIPTION - FULL SIZE, SPARE WHEEL WITH MATCHING TIRE

The spare is a full usage wheel with a matching tire, It can be used within the (posted legal) speed limits or distance limitations as of the rest of the vehicles four tires. Refer to Owner's Manual for complete details.

BODY

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE AN OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

- **AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.**
- **DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.

- **Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **Always have a fire extinguisher ready for use when welding.**
- **Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.**

- **Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

BODY (Continued)

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS**WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.**

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

DIAGNOSIS AND TESTING - WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

BODY (Continued)

ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

STANDARD PROCEDURE - BODY LUBRICATION

All mechanisms and linkages should be lubricated when necessary. This will maintain ease of operation and provide protection against rust and excessive wear. The weatherstrip seals should be lubricated to prolong their life as well as to improve door sealing.

All applicable exterior and interior vehicle operating mechanisms should be inspected and cleaned. Pivot/sliding contact areas on the mechanisms should then be lubricated.

(1) When necessary, lubricate the operating mechanisms with the specified lubricants.

(2) Apply silicone lubricant to a cloth and wipe it on door seals to avoid over-spray that can soil passenger's clothing.

(3) Before applying lubricant, the component should be wiped clean. After lubrication, any excess lubricant should be removed.

(4) The hood latch, latch release mechanism, latch striker, and safety latch should be lubricated periodically.

(5) The door lock cylinders should be lubricated twice each year (preferably autumn and spring).

- Spray a small amount of lock cylinder lubricant directly into the lock cylinder.
- Apply a small amount to the key and insert it into the lock cylinder.
- Rotate it to the locked position and then back to the unlocked position several times.
- Remove the key. Wipe the lubricant from it with a clean cloth to avoid soiling of clothing.

STANDARD PROCEDURE - HEAT STAKING

(1) Remove trim panel.

(2) Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.

(3) Heat stake the components.

(a) If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(b) If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(4) Allow the repaired area to cool and verify the repair.

(5) Install trim panel.

STANDARD PROCEDURE - PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

BODY (Continued)

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS**WARNING:**

- **EYE PROTECTION SHOULD BE USED WHEN SERVICING COMPONENTS. PERSONAL INJURY CAN RESULT.**
- **USE AN OSHA APPROVED BREATHING MASK WHEN MIXING EPOXY, GRINDING, AND SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**

- **AVOID PROLONGED SKIN CONTACT WITH RESIN, PETROLEUM, OR ALCOHOL BASED SOLVENTS. PERSONAL INJURY CAN RESULT.**

- **DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES

TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel (Fig. 1). To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

80b6fede

Fig. 1 PANEL SECTIONING

- 1 - EXISTING PANEL
- 2 - NEW PANEL
- 3 - PANEL ADHESIVE
- 4 - BONDING STRIP

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun.

After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement (Fig. 2) and (Fig. 3). Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair (Fig. 4). It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

- 2 - PANEL ADHESIVE
- 3 - BONDING STRIP

Fig. 3 PANEL REINFORCEMENT

- 1 - PANEL ADHESIVE
- 2 - REINFORCEMENT

Fig. 4 BEVELING ANGLE - 20 DEGREE

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used (Fig. 5).

- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.

- When plastic repairs are required, it is recommended that the part be left on the vehicle when every possible. That will save time, and the panel will remain stationary during the repair. Misalign-

ment can cause stress in the repair areas and can result in future failure.

Fig. 5 FIBERGLASS TAPE

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind (Fig. 7) (Fig. 6).

Fig. 6 DAMAGE COMPONENT

- 1 - PUNCTURE

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area

BODY (Continued)

should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material (Fig. 7). Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

Fig. 7 DAMAGED PANEL CUTOUT AND PATCH

- 1 - CUTOUT
- 2 - DAMAGED BODY PANEL
- 3 - 4 MM (0.160 IN.) HOLES
- 4 - PATCH CUT TO SIZE

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

(1) Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required (Fig. 8).

(2) Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.

(3) Apply a liberal coat of adhesive over the reinforcement mesh (Fig. 8). If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.

(4) After patch has cured, peel waxed paper or plastic from the back of the patch.

(5) If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

Fig. 8 FABRICATED PANEL

- 1 - STRUCTURAL ADHESIVE
- 2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE
- 3 - WIDTH OF V-GROOVE
- 4 - WAXED PAPER

PANEL PATCH INSTALLATION

(1) Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.

(2) Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.

(3) Using the pattern as a guide, cut the patch to size.

(4) Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.

(5) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) from edge of cutout hole (Fig. 7).

(6) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.

BODY (Continued)

(7) Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.

(8) Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.

(9) Mix enough adhesive to cover one side of all support squares.

(10) Apply adhesive to cover one side of all support squares.

(11) Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares (Fig. 9).

Fig. 9 SECURE SUPPORT SQUARES TO BODY PANEL

- 1 - SUPPORT SQUARES
- 2 - SCREWS
- 3 - DAMAGED BODY PANEL

(12) Position patch in cutout against support squares and adjust patch until the gap is equal along all sides (Fig. 10).

(13) Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

(14) Apply a coat of adhesive to the exposed ends of the support squares (Fig. 11).

(15) Install screws to hold the patch to support squares (Fig. 12). Tighten screws until patch surface is flush with panel surface.

(16) Allow adhesive to cure, and remove all screws.

(17) Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch (Fig. 13). With compressed air, blow dust from around patch.

(18) Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch (Fig. 14).

(19) Mix enough adhesive to cover the entire patch area.

(20) Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair (Fig. 15).

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

BODY (Continued)

STANDARD PROCEDURE - BUZZ, SQUEAK & RATTLE

Buzz, Squeak & Rattles (BSR) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.

- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using the Mopar® Parts BSR Noise Reduction Kit. This kit contains various tapes including foam, flock and anti-squeak used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the Buzz, Squeak & Rattle Kit table for material contents and usage.

BUZZ, SQUEAK & RATTLE KIT

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
Itch And Squeak Tape	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 225° Fahrenheit (-40° to 107° Celsius)
Black Nylon Flock	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
High Density Urethane Foam	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
Open Cell Foam Tape	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
Closed Cell Low Density Foam Tape	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
NYE® Grease 880	Long life.	Suspensions. Examples: Strut busings, sway bars.	-40° to 390° Fahrenheit (-40° to 200° Celsius)
Krytox® Oil	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-30° to 400° Fahrenheit (-34° to 205° Celsius)
Krytox® Grease	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-30° to 400° Fahrenheit (-34° to 205° Celsius)

- 8 - LATCH BOLT

INSTALLATION

- (1) Position check cable on tailgate.
- (2) Install bolt attaching small end of cable to tailgate.
- (3) Tighten tailgate check cable bolt to 23 N·m (17 ft. lbs.).
- (4) Position large end of cable onto stud head and slide downward to secure lock tab.

COVER

REMOVAL

- (1) Open the tailgate.
- (2) Remove the eight screws and remove tailgate liner, if equipped.
- (3) Remove the bolts and remove the cover. (Fig. 3)

Fig. 3 TAILGATE ASSEMBLY

- 1 - LATCH ASSEMBLY
- 2 - CONTROL ASSEMBLY
- 3 - ACTUATOR ROD (2)
- 4 - COVER
- 5 - BOLTS (10)

INSTALLATION

- (1) Install the cover and install the bolts and tighten by hand.
- (2) Install the liner and install the screws, if equipped.

HINGE

REMOVAL

- (1) Remove the tailgate. (Refer to 23 - BODY/TAILGATE/TAILGATE - REMOVAL)
- (2) Remove the two screws and remove the hinge/pivot. (Fig. 4)

INSTALLATION

- (1) Install the hinge/pivot and install the screws.
- (2) Tighten the screws to 34 N·m (25 ft. lbs.).
- (3) Install the tailgate. (Refer to 23 - BODY/TAILGATE/TAILGATE - INSTALLATION)

80dc8807

Fig. 4 TAILGATE HINGE

- 1 - HINGE/PIVOT
- 2 - TAILGATE PILLAR
- 3 - CLIP/BUSHING
- 4 - BOLTS (2)

LATCH

REMOVAL

- (1) Remove the cover. (Refer to 23 - BODY/TAILGATE/COVER - REMOVAL)
- (2) Using a grease pencil or equivalent, mark the actuator rod for installation.
- (3) Disconnect the actuator rod at the control assembly. (Fig. 3)
- (4) Remove the latch bolt and the check cable bolt. (Fig. 5)
- (5) Remove the latch and actuator rod assembly.

INSTALLATION

- (1) Install the latch and actuator rod assembly.
- (2) Install the latch and the check cable bolts and tighten to 23 N·m (17 ft. lbs.).
- (3) Connect the actuator rod to the control assembly line up the marks made during removal.
- (4) Install the cover. (Refer to 23 - BODY/TAILGATE/COVER - INSTALLATION)

LATCH STRIKER

REMOVAL

- (1) Open tailgate.
- (2) Using a grease pencil or equivalent, mark outline of striker on cargo box jamb to aid installation.
- (3) Using a Torx drive wrench, remove striker and washer from cargo box.

LATCH STRIKER (Continued)

INSTALLATION

(1) Position striker and washer on jamb using alignment outline as reference and install with Torx drive wrench.

(2) Tighten the striker to 34 N·m (25 ft. lbs.).

RELEASE HANDLE/LATCH REMOTE

REMOVAL

(1) Remove the tailgate cover. (Refer to 23 - BODY/TAILGATE/COVER - REMOVAL)

(2) Using a grease pencil or equivalent, mark the latch actuator rods for ease of installation.

(3) Disconnect the latch actuator rods. (Fig. 3)

(4) Remove the control assembly nuts and remove the control assembly and the exterior handle. (Fig. 5)

Fig. 5 LATCH HANDLE - LATCH

- 1 - EXTERIOR HANDLE
- 2 - CONTROL ASSEMBLY
- 3 - NUTS (2)
- 4 - TAILGATE
- 5 - LATCH
- 6 - CHECK CABLE
- 7 - CHECK/LATCH BOLT
- 8 - LATCH BOLT

INSTALLATION

(1) Install the handle and the control assembly.
 (2) Install the nuts and tighten to 7 N·m (60 in. lbs.).

(3) Connect the actuator rods using the marks made during removal.

(4) Install the cover. (Refer to 23 - BODY/TAILGATE/COVER - INSTALLATION)

TAILGATE

REMOVAL

(1) Open the tailgate.

(2) Disconnect the tailgate check cables (Fig. 6). (Refer to 23 - BODY/TAILGATE/CHECK CABLE - REMOVAL)

(3) Close tailgate until the notch in the right hand collar aligns with the pivot pin.

(4) Slip tailgate hinge collar from pivot pins.

(5) Slide tailgate to the right and separate left hand collar from the pivot pin.

(6) Separate tailgate from vehicle.

Fig. 6 TAILGATE ASSEMBLY

- 1 - LATCH STRIKER
- 2 - CHECK CABLE BOLT
- 3 - CHECK CABLE
- 4 - TAILGATE
- 5 - HINGE BUSHING

INSTALLATION

(1) Position tailgate collar on left hand pivot pin and slide tailgate to the left.

(2) Raise tailgate until the notch in the right hand collar aligns with the pivot pin.

(3) Connect the tailgate check cables. (Refer to 23 - BODY/TAILGATE/CHECK CABLE - INSTALLATION)

DOOR

REMOVAL

- (1) Disconnect the door wire harness electrical connector at the A-pillar. (Fig. 1)
- (2) Using a grease pencil or equivalent, mark the outline of the door hinges on the door to aid in installation.
- (3) Support the door with a suitable lifting device.

NOTE: The epoxy bonded washers should not be separated from the hinge. If the washers are removed the door may have to be re-adjusted.

- (4) Remove the nuts and bolts attaching the door hinges to the door.

INSTALLATION

- (1) Support the door with a suitable lifting device and install the door onto the hinges.
- (2) Install the washers, if there were removed previously, nuts and tighten to 28 N·m (21 ft. lbs.).
- (3) Connect the electrical connectors.
- (4) Adjust the door as necessary. (Refer to 23 - BODY/DOOR - FRONT/DOOR - ADJUSTMENTS)

DOOR (Continued)

80d29774

Fig. 1 FRONT DOOR

- 1 - NUTS (2)
- 2 - UPPER HINGE
- 3 - STUDS
- 4 - FRONT DOOR
- 5 - WIRE HARNESS
- 6 - LOWER HINGE
- 7 - ELECTRICAL CONNECTORS (2)
- 8 - BOLTS (2)

ADJUSTMENTS

ADJUSTMENT

NOTE: For vehicles with four doors, it is recommended that you adjust the rear door before adjusting the front door. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.

- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.

- A suitable body sealant should be used when removing or moving the hinges.

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.

- (1) Support the door with a suitable lifting device.
- (2) Loosen the hinge to hinge pillar fasteners. (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
- (3) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

- (4) Tighten the hinge pillar fasteners to 28 N-m (21 ft. lbs.).

UP/DOWN

NOTE: Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

- (1) Support the door with a suitable lifting device.
- (2) Loosen the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)
- (3) Loosen the hinge to door fasteners (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL) or loosen the hinge to hinge pillar fasteners (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL).
- (4) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (5) Tighten the hinge pillar fasteners or the door to hinges fasteners to 28 N-m (21 ft. lbs.).
- (6) Tighten the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

- (1) Support the door with a suitable lifting device.
- (2) Loosen the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)
- (3) Loosen the hinge to door fasteners. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)

DOOR (Continued)

(4) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

(5) Tighten the door to hinges fasteners to 28 N-m (21 ft. lbs.).

(6) Tighten the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

DOOR GLASS

REMOVAL

(1) Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)

(2) Reinstall the window handle, if equipped.

(3) Remove the window switch from the door trim panel and reconnect it to the door wire harness, if equipped.

(4) Raise the window to the position shown and remove the two nuts attaching the glass to the window regulator. (Fig. 2)

(5) Remove the two front run channel screws. (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - REMOVAL)

(6) Remove the inner belt molding. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT WEATHERSTRIP - REMOVAL)

(7) Disengage the glass from the regulator and lower into the door.

(8) Twist the glass forward in the door window opening and remove.

Fig. 2 DOOR GLASS POSITIONING

- 1 - SIGHT WINDOW
- 2 - WINDOW REGULATOR
- 3 - SIGHT WINDOW
- 4 - REGULATOR STABILIZER

INSTALLATION

(1) Position the glass into the window opening.

(2) Engage the glass into the glass run weatherstrip.

(3) Raise the glass within the door opening and connect the window regulator to the lift plate.

(4) Install the nuts and tighten to 10 N-m (89 in. lbs.).

(5) Install the inner belt molding. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT WEATHERSTRIP - INSTALLATION)

(6) Position the front run channel and install the screws. (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - INSTALLATION)

(7) Remove the window switch from the wire harness, if equipped.

(8) Remove the window handle, if equipped.

(9) Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)

EXTERIOR HANDLE

REMOVAL

(1) Remove the door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL)

(2) Disconnect the lock switch electrical connector, if equipped. (Fig. 3)

(3) Disconnect the actuator rods at the handle.

(4) Remove the nuts and remove the handle.

Fig. 3 EXTERIOR HANDLE

- 1 - EXTERIOR HANDLE
- 2 - NUTS (2)
- 3 - ELECTRICAL CONNECTOR
- 4 - FRONT DOOR
- 5 - DOOR LATCH ASSEMBLY
- 6 - LATCH ACTUATOR ROD
- 7 - LOCK SWITCH WIRE HARNESS
- 8 - KEY CYLINDER ACTUATOR ROD

EXTERIOR HANDLE (Continued)

INSTALLATION

- (1) Install the exterior handle and install the nuts.
- (2) Connect the actuator rods at the handle
- (3) Connect the lock switch electrical connector, if equipped.
- (4) Install the door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION)

GLASS RUN CHANNEL

REMOVAL

- (1) Raise glass into the full up position.
- (2) Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)

FRONT RUN CHANNEL

- (1) Remove the window regulator. (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - REMOVAL)
- (2) Loosen the front run channel screws, slide up and disengage from the door. (Fig. 4)
- (3) Separate the glass run weatherstrip from the channel and remove the front channel.

Fig. 4 FRONT RUN CHANNEL

- 1 - FRONT GLASS RUN CHANNEL
- 2 - UPPER SCREW
- 3 - LOWER SCREW
- 4 - DOOR PANEL OPENING
- 5 - RUN CHANNEL MOUNTING SLOTS (2)

REAR RUN CHANNEL

- (1) On standard cab models, remove the screws from the side of the door. (Fig. 5)
- (2) On quad cab models, remove the lower screw from the side of the door, loosen the upper screw and disengage from the door. (Fig. 6)

- (3) Separate the glass run weatherstrip from the rear channel and remove the channel.

Fig. 5 REAR RUN CHANNEL - QUAD CAB

- 1 - SCREWS
- 2 - REAR GLASS RUN CHANNEL
- 3 - DOOR PANEL OPENING

Fig. 6 REAR RUN CHANNEL - STANDARD CAB

- 1 - LOWER SCREW
- 2 - DOOR PANEL OPENING
- 3 - REAR GLASS RUN CHANNEL
- 4 - UPPER SCREW

GLASS RUN CHANNEL (Continued)

INSTALLATION

FRONT RUN CHANNEL

- (1) Install the channel, position the screws in the door panel slots and slide into place.
- (2) Tighten the screws to 10 N·m (89 in. lbs.).
- (3) Install the window regulator. (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - INSTALLATION)

REAR RUN CHANNEL

- (1) On quad cab models, install the channel and slide the upper screw into the slot.
- (2) Install the lower screw and tighten both upper and lower screws to 10 N·m (89 in. lbs.).
- (3) On standard cab models, install the channel and install the screws.
- (4) Tighten the screws to 10 N·m (89 in. lbs.).

BOTH CHANNELS

- (1) Stuff the glass run weatherstrip into the channels.
- (2) Verify correct window operation.
- (3) Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)

HINGE

REMOVAL

- (1) Remove the door. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
- (2) Using a grease pencil or equivalent, mark the hinge location and remove the bolts.

INSTALLATION

- (1) Install the hinges and bolts.
- (2) Tighten bolts to 28 N·m (21 ft. lbs.).
- (3) Install the door. (Refer to 23 - BODY/DOOR - FRONT/DOOR - INSTALLATION)

INSIDE HANDLE ACTUATOR

REMOVAL

- (1) Remove the screw and remove the inside handle. (Fig. 7)
- (2) Remove the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (3) Disconnect the latch actuator rod. (Fig. 8)
- (4) Remove the nuts and remove the remote handle actuator.

INSTALLATION

- (1) Install the remote handle actuator and install the nuts.

Fig. 7 INSIDE HANDLE ACTUATOR

- 1 - BOLT
- 2 - HANDLE
- 3 - TRIM PANEL OPENING

Fig. 8 REMOTE HANDLE ACTUATOR

- 1 - DOOR
- 2 - LATCH ASSEMBLY
- 3 - LATCH ACTUATOR ROD
- 4 - NUTS (2)
- 5 - HANDLE REMOTE

- (2) Tighten the nuts to 10 N·m (89 in. lbs.).
- (3) Connect the latch actuator rod.

INSIDE HANDLE ACTUATOR (Continued)

- (4) Install the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)
- (5) Install the inside handle and install the bolt.
- (6) Tighten the bolt to 9 N·m (80 in. lbs.).

LATCH

REMOVAL

- (1) Raise the window to the full up position.
- (2) Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)
- (3) Disconnect the actuator rods.
- (4) Remove the bolts. (Fig. 9)
- (5) Disconnect the electrical connector and remove the latch.

Fig. 9 LATCH ASSEMBLY

- 1 - DOOR
- 2 - ELECTRICAL CONNECTOR
- 3 - LATCH ASSEMBLY
- 4 - BOLTS

INSTALLATION

- (1) Connect the electrical connector and install the latch assembly.
- (2) Install the bolts and tighten to 10 N·m (89 in. lbs.).
- (3) Connect the actuator rods.
- (4) Adjust the latch as needed. (Refer to 23 - BODY/DOOR - FRONT/LATCH - ADJUSTMENTS)
- (5) Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/LATCH - INSTALLATION)

ADJUSTMENTS

ADJUSTMENT

- (1) Locate access hole and remove the mylar tape covering it. (Fig. 10)
- (2) Insert a 5/32-inch hex-wrench through hole and into adjustment screw. Loosen screw.
- (3) Operate outside handle several times to release any restriction because of mis-alignment.
- (4) Tighten adjustment screw to 3 N·m (30 in. lbs.).
- (5) Test handle for proper operation.

Fig. 10 LATCH ADJUSTMENT SCREW - TYPICAL

- 1 - DOOR LATCH
- 2 - MYLAR TAPE
- 3 - ADJUSTMENT SCREW

LATCH STRIKER

REMOVAL

- (1) Using a grease pencil or equivalent, mark the position of the striker.
- (2) Remove the bolts and remove the striker.

INSTALLATION

- (1) Install the striker and install the bolts.
- (2) Tighten the bolts to 28 N·m (21 ft. lbs.).
- (3) Adjust the striker if needed. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - ADJUSTMENTS)

LATCH STRIKER (Continued)

ADJUSTMENTS

ADJUSTMENT

- (1) Using a grease pencil or equivalent, mark the position of the striker to aid in adjustment.
- (2) Loosen the striker bolts.
- (3) Change the striker position to adjust the rear gap and flush measurement. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (4) Tighten the bolts to 28 N·m (21 ft. lbs.).

LOCK CYLINDER

REMOVAL

- (1) Remove the exterior handle. (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL)
- (2) Remove the clip and remove the lock cylinder lever and switch, if equipped.
- (3) Remove the screw and remove the lock cylinder. (Fig. 11)

80d2ab52

Fig. 11 LOCK CYLINDER

- 1 - LOCK CYLINDER
- 2 - EXTERIOR HANDLE
- 3 - SCREW
- 4 - LOCK SWITCH WIRE HARNESS

INSTALLATION

- (1) Install the lock cylinder and install the screw.
- (2) Install the lock cylinder switch, if equipped, lever and retaining clip.
- (3) Install the exterior handle. (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION)

TRIM PANEL

REMOVAL

- (1) Remove the window crank, if equipped. (Fig. 13)
- (2) Remove the interior handle. (Refer to 23 - BODY/DOOR - FRONT/INSIDE HANDLE ACTUATOR - REMOVAL)
- (3) Remove the screws at the mirror flag and near the inside handle. (Fig. 12)

CAUTION: Trim panel is attached to the door using hooks molded into the panel. Do not pull the trim panel straight off or damage to the panel and/or power switch assembly may occur.

- (4) Lift the trim panel up off the belt seal and attachment hooks and separate the panel from the door slightly.
- (5) Disconnect the power window switch electrical connector, if equipped, and remove the trim panel.

80d2b273

Fig. 12 TRIM PANEL ASSEMBLY

- 1 - SCREW INSERT (2)
- 2 - SCREWS (2)
- 3 - DOOR TRIM PANEL
- 4 - LOWER SCREWS (3)
- 5 - ATTACHMENT HOOKS

INSTALLATION

- (1) Install the window switch into the trim panel, if equipped.
- (2) Position the trim panel onto the lower hooks and connect the power window switch electrical connector, if equipped.
- (3) Position the remaining trim panel attachment hooks into the door panel and seat the trim panel into the belt seal fully.
- (4) Install the screws near the inside handle and at the mirror flag.

TRIM PANEL (Continued)

80ad2f28

Fig. 13 WINDOW CRANK REMOVAL TOOL

- 1 - WINDOW CRANK REMOVAL TOOL
2 - WINDOW CRANK

(5) Install the interior handle. (Refer to 23 - BODY/DOOR - FRONT/INSIDE HANDLE ACTUATOR - INSTALLATION)

(6) Install the window crank, if equipped.

WATERDAM

REMOVAL

CAUTION: Do not allow the waterdam or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the waterdam during removal and installation.

If the waterdam becomes contaminated or damaged, replace the waterdam.

(1) Remove the inside handle actuator. (Refer to 23 - BODY/DOOR - FRONT/INSIDE HANDLE ACTUATOR - REMOVAL)

(2) Remove the speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)

(3) Separate the waterdam from the inner door panel and off of the latch linkages.

INSTALLATION

CAUTION: Do not allow the waterdam or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the waterdam during removal and installation.

If the waterdam becomes contaminated or damaged, replace the waterdam.

(1) Position the wire harness and actuator rods through the holes in the waterdam.

(2) Secure the waterdam to the inner door panel.

(3) Install the speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)

(4) Install the inside handle actuator. (Refer to 23 - BODY/DOOR - FRONT/INSIDE HANDLE ACTUATOR - INSTALLATION)

WINDOW REGULATOR - POWER

REMOVAL

(1) Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)

(2) Remove the window switch from the door trim panel and reconnect it to the door harness.

(3) Raise the window to the position shown and remove the nuts. (Fig. 14)

(4) Disengage the door glass from the regulator lift plate and position into the full up position.

(5) Secure the glass in the up position using a wood wedge or equivalent.

(6) Lower the regulator.

(7) Remove the stabilizer nuts.

(8) Remove the forward regulator bolt and loosen the other two. (Fig. 15)

(9) Slide the regulator up and out of the keyhole slots in the door panel.

(10) Disconnect the electrical connector and remove the regulator.

**Fig. 14 DOOR GLASS POSITIONING**

- 1 - SIGHT WINDOW
2 - WINDOW REGULATOR
3 - SIGHT WINDOW
4 - REGULATOR STABILIZER

WINDOW REGULATOR - POWER (Continued)

- 2 - INNER DOOR PANEL
- 3 - STABILIZER NUTS (2)
- 4 - REGULATOR
- 5 - FORWARD BOLT
- 6 - WIRE HARNESS
- 7 - BOLTS (2)

INSTALLATION

- (1) Install the regulator through the door panel opening and connect the electrical connector.
- (2) Position the regulator bolts into the keyhole slots and slide into place.
- (3) Install the forward bolt and tighten all three to 10 N·m (89 in. lbs.).
- (4) Position the stabilizer, install the nuts and tighten to 10 N·m (89 in. lbs.).
- (5) Raise the regulator to the position shown in (Fig. 14).
- (6) Remove the glass support and connect to the regulator lift plate.
- (7) Install the glass nuts and tighten to 10 N·m (89 in. lbs.).
- (8) Disconnect the window switch and install into the door trim panel.
- (9) Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)

WINDOW REGULATOR - MANUAL**REMOVAL**

- (1) Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)
- (2) Reinstall the window handle and raise the window to the position shown and remove the nuts. (Fig. 14)
- (3) Disengage the door glass from the regulator lift plate and position into the full up position.
- (4) Secure the glass in the up position using a wood wedge or equivalent.
- (5) Lower the regulator.
- (6) Remove the stabilizer nuts.
- (7) Remove the two lower and loosen the two upper bolts. (Fig. 16)
- (8) Slide the regulator up and out of the keyhole slot.
- (9) Remove the regulator from the door panel opening.

80d2aafa

Fig. 16 WINDOW REGULATOR - MANUAL

- 1 - DOOR
- 2 - REGULATOR BOLTS (4)
- 3 - REGULATOR
- 4 - STABILIZER NUTS (2)

WINDOW REGULATOR - MANUAL (Continued)

INSTALLATION

- (1) Install the regulator through the hole in the inner door panel.
- (2) Position the regulator and slide the upper bolts into the keyhole slots.
- (3) Install the lower two bolts.
- (4) Tighten the regulator bolts to 10 N·m (89 in. lbs.).
- (5) Position the stabilizer, install the nuts and tighten to 10 N·m (89 in. lbs.).
- (6) Using the window handle raise the regulator to the position shown in (Fig. 14).
- (7) Remove the glass support and connect to the regulator lift plate.
- (8) Install the glass nuts and tighten to 10 N·m (89 in. lbs.).
- (9) Remove the window handle and install the waterdam.

CAUTION: Do not use a drill to remove the heat stakes.

- (2) Remove the heat stakes using a razor knife or equivalent.
- (3) Release the tabs and remove the mirror flag.

INSTALLATION

NOTE: Clean the excess heat staking off of the studs to aid installation.

- (1) Install the new mirror flag over the tabs and install the screws into the heat stake studs.
- (2) Install the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

SIDE VIEW MIRROR FLAG

REMOVAL

- (1) Remove the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)

DOOR

REMOVAL

(1) Disconnect the door wire harness electrical connector at the b-pillar. (Fig. 1)

(2) Using a grease pencil or equivalent, mark the outline of the door hinges on the door to aid in installation.

(3) Support the door with a suitable lifting device.

NOTE: The epoxy bonded washers should not be separated from the hinge. If the washers are removed the door may have to be re-adjusted.

(4) Remove the nuts and bolts attaching the door hinges to the door.

INSTALLATION

(1) Support the door with a suitable lifting device and install the door onto the hinges.

(2) Install the bolts, nuts and washers, if there were removed previously, and tighten to 28 N·m (21 ft. lbs.).

(3) Connect the electrical connector.

(4) Adjust the door as necessary. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

ADJUSTMENTS

ADJUSTMENT

NOTE: For vehicles equipped with four doors, it is recommended that you adjust the rear door before adjusting the front door.

- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.

- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper fasteners to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.

- 3 - UPPER STUD
- 4 - REAR DOOR
- 5 - WIRE HARNESS
- 6 - LOWER STUD
- 7 - LOWER HINGE
- 8 - ELECTRICAL CONNECTOR
- 9 - BOLTS (2)

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.

- (1) Support the door with a suitable lifting device.
- (2) Loosen the hinge to hinge pillar fasteners. (Refer to 23 - BODY/DOORS - REAR/HINGE - REMOVAL)
- (3) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (4) Tighten to hinge pillar fasteners to 28 N·m (21 ft. lbs.). (Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION)

NOTE: Use a suitable body sealer on the hinge to body mating surfaces.

UP/DOWN

NOTE: Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or

the hinge to door fasteners and moving the door to the correct position.

NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

- (1) Support the door with a suitable lifting device.
- (2) Remove the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - REMOVAL)
- (3) Loosen the hinge to hinge pillar fasteners (Refer to 23 - BODY/DOORS - REAR/HINGE - REMOVAL) or loosen the hinge to door fasteners (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL).
- (4) Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (5) Tighten to hinge pillar fasteners or the door to hinges fasteners and fasteners to 28 N·m (21 ft. lbs.). (Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION)
- (6) Install the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - INSTALLATION)

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

- (1) Support the door with a suitable lifting device.
- (2) Remove the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - REMOVAL)
- (3) Loosen the hinge to door fasteners. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)
- (4) Adjust the front of the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
- (5) Tighten the door to hinges fasteners to 28 N·m (21 ft. lbs.).
- (6) Install the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - INSTALLATION)

DOOR GLASS

REMOVAL

(1) Remove the glass run channels. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - REMOVAL)

(2) Remove the glass support and place the glass into the bottom of the door.

(3) Separate the glass run weatherstrip from the rear of the window opening.

(4) Remove the inner belt molding. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT WEATHERSTRIP - REMOVAL)

(5) Remove the glass from the window opening.

INSTALLATION

(1) Install the glass through the window opening and pace the glass into the bottom of the door.

(2) Install the inner belt molding. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT WEATHERSTRIP - INSTALLATION)

(3) Stuff the glass run weatherstrip into the window frame.

(4) Secure the glass in the up position using a wood wedge or equivalent.

(5) Install the glass run channels. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - INSTALLATION)

EXTERIOR HANDLE

REMOVAL

(1) Remove the front glass run channel. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - REMOVAL)

(2) Disconnect the latch actuator rod. (Fig. 2)

(3) Remove the nuts and remove the handle.

INSTALLATION

(1) Install the latch and install the nuts.

(2) Connect the latch actuator rod.

(3) Install the front glass run channel. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - INSTALLATION)

GLASS RUN CHANNEL

REMOVAL

(1) Remove the window regulator. (Refer to 23 - BODY/DOORS - REAR/WINDOW REGULATOR - REMOVAL)

(2) Remove the bottom screws and loosen the top screws from bolt channels. (Fig. 3) and (Fig. 4)

80d2e66a

Fig. 2 EXTERIOR HANDLE

- 1 - LATCH ACTUATOR ROD
- 2 - LATCH
- 3 - NUTS (2)

(3) Slide the channels up to disengage from the keyhole slots.

(4) Separate the glass run weatherstrip from the channel and remove the channels.

80d2e8fd

Fig. 3 FRONT RUN CHANNEL

- 1 - BOLTS
- 2 - FRONT RUN CHANNEL

GLASS RUN CHANNEL (Continued)

80d2e906

Fig. 4 REAR RUN CHANNEL

- 1 - REAR RUN CHANNEL
2 - SCREW LOCATIONS

INSTALLATION

- (1) Position the run channels into the door and engage the upper screws into the keyhole slots.
- (2) Install the lower screws and tighten to 10 N-m (89 in. lbs.).
- (3) Tighten the upper screws to 10 N-m (89 in. lbs.).
- (4) Stuff the glass run weatherstrip into the channels.
- (5) Verify correct window operation.
- (6) Install the window regulator. (Refer to 23 - BODY/DOORS - REAR/WINDOW REGULATOR - INSTALLATION)

HINGE**REMOVAL**

NOTE: It is not necessary to remove the door to replace the hinges if they are replaced one at a time.

NOTE: The epoxy coated washers should not be removed from the hinge. If the washers are removed the door may have to be re-adjusted.

- (1) Open the front door

UPPER HINGE

- (1) Using a grease pencil or equivalent, mark the position of the hinge on the door and b-pillar.
- (2) Remove the nut and bolt attaching the hinge to the door.
- (3) Remove the three bolts attaching the hinge to the b-pillar and remove the hinge.

LOWER HINGE

- (1) Using a grease pencil or equivalent, mark the position of the hinge on the door and b-pillar.
- (2) Remove the lower b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)
- (3) Remove the nut and bolt attaching the hinge to the door.
- (4) Remove the two bolts attaching the hinge to the b-pillar.
- (5) From the inside of the vehicle remove the remaining bolt attaching the hinge to the b-pillar and remove the hinge.

INSTALLATION**UPPER HINGE**

- (1) Install the hinge to door washers, if there were removed previously, nut and bolt and tighten to 28 N-m (21 ft. lbs.).
- (2) Install the three hinge to b-pillar bolts and tighten to 28 N-m (21 ft. lbs.).
- (3) Adjust the door if needed. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

LOWER HINGE

- (1) Install the hinge and install the b-pillar bolts.
- (2) Tighten the bolts to 28 N-m (21 ft. lbs.).
- (3) Install the hinge to door washers, if there were removed previously, nut and bolt and tighten to 28 N-m (21 ft. lbs.).
- (4) Adjust the door if needed. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)
- (5) Install the lower b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)

INSIDE HANDLE ACTUATOR**REMOVAL**

- (1) Remove the screw and remove the inside handle. (Fig. 5)
- (2) Remove the door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (3) Disconnect the latch actuator rod. (Fig. 6)
- (4) Remove the nuts and remove the remote handle actuator.

INSIDE HANDLE ACTUATOR (Continued)

80d2ec3d

Fig. 5 INSIDE HANDLE ACTUATOR

- 1 - TRIM PANEL OPENING
- 2 - INSIDE LATCH HANDLE
- 3 - BOLT

80d2e9a7

Fig. 6 REMOTE HANDLE ACTUATOR

- 1 - NUTS (2)
- 2 - LATCH ACTUATOR ROD
- 3 - HANDLE REMOTE

INSTALLATION

- (1) Install the remote handle actuator and install the nuts.
- (2) Tighten the nuts to 10 N-m (89 in. lbs.).
- (3) Connect the latch actuator rod.
- (4) Install the door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)
- (5) Install the inside handle and install the bolt.

- (6) Tighten the bolt to 9 N-m (80 in. lbs.).

LATCH**REMOVAL**

- (1) Raise the window to the full up position.
- (2) Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)
- (3) Disconnect the actuator rods.
- (4) Remove the bolts. (Fig. 7)
- (5) Disconnect the electrical connector and remove the latch.

80d2ed77

Fig. 7 LATCH ASSEMBLY

- 1 - DOOR
- 2 - ELECTRICAL CONNECTOR
- 3 - LATCH ASSEMBLY
- 4 - BOLTS

INSTALLATION

- (1) Connect the electrical connector and install the latch assembly.
- (2) Install the bolts and tighten to 10 N-m (89 in. lbs.).
- (3) Connect the actuator rods.
- (4) Adjust the latch as needed. (Refer to 23 - BODY/DOORS - REAR/LATCH - ADJUSTMENTS)
- (5) Install the waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION)

LATCH (Continued)

ADJUSTMENTS

ADJUSTMENT

- (1) Locate access hole and remove the mylar tape covering it. (Fig. 8)
- (2) Insert a 5/32-inch hex-wrench through hole and into adjustment screw. Loosen screw.
- (3) Operate outside handle several times to release any restriction because of mis-alignment.
- (4) Tighten adjustment screw to 3 N·m (30 in. lbs.).
- (5) Test handle for proper operation.

Fig. 8 LATCH ADJUSTMENT SCREW - TYPICAL

- 1 - DOOR LATCH
- 2 - MYLAR TAPE
- 3 - ADJUSTMENT SCREW

LATCH STRIKER

REMOVAL

- (1) Using a grease pencil or equivalent, mark the position of the striker.
- (2) Remove the bolts and remove the striker.

INSTALLATION

- (1) Install the striker and install the bolts.
- (2) Tighten the bolts to 28 N·m (21 ft. lbs.).
- (3) Adjust the striker if needed. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - ADJUSTMENTS)

ADJUSTMENTS

ADJUSTMENT

- (1) Using a grease pencil or equivalent, mark the position of the striker to aid in adjustment.
- (2) Loosen the striker bolts.
- (3) Change the striker position to adjust the rear gap and flush measurement. (Refer to 23 - BODY/

BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

- (4) Tighten the bolts to 28 N·m (21 ft. lbs.).

TRIM PANEL

REMOVAL

- (1) Remove the window crank, if equipped. (Fig. 10)
- (2) Remove the interior handle. (Refer to 23 - BODY/DOORS - REAR/INSIDE HANDLE ACTUATOR - REMOVAL)
- (3) Remove the screw near the inside handle. (Fig. 9)

CAUTION: Trim panel is attached to the door using hooks molded into the panel. Do not pull the trim panel straight off or damage to the panel and/or power switch assembly may occur.

- (4) Lift the trim panel up off the belt seal and attachment hooks and separate the panel from the door slightly.
- (5) Disconnect the power window switch electrical connector, if equipped, and remove the trim panel.

Fig. 9 TRIM PANEL

- 1 - DOOR
- 2 - ELECTRICAL CONNECTOR
- 3 - ATTACHMENT HOOKS
- 4 - SCREW
- 5 - TRIM PANEL

INSTALLATION

- (1) Position the trim panel onto the lower hooks and connect the power window switch electrical connector, if equipped.
- (2) Position the remaining trim panel attachment hooks into the door panel and seat the trim panel into the belt seal fully.
- (3) Install the screw near the inside handle.

TRIM PANEL (Continued)

80ad2f28

Fig. 10 WINDOW CRANK REMOVAL TOOL

- 1 - WINDOW CRANK REMOVAL TOOL
2 - WINDOW CRANK

(4) Install the interior handle. (Refer to 23 - BODY/DOORS - REAR/INSIDE HANDLE ACTUATOR - INSTALLATION)

(5) Install the window crank, if equipped.

WATERDAM

REMOVAL

(1) Remove the inside handle actuator. (Refer to 23 - BODY/DOORS - REAR/INSIDE HANDLE ACTUATOR - REMOVAL)

(2) Remove the speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)

(3) Separate the waterdam from the inner door panel and off of the latch linkages.

INSTALLATION

(1) Position the wire harness and actuator rods through the holes in the waterdam.

(2) Secure the waterdam to the inner door panel.

(3) Install the speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)

(4) Install the inside handle actuator. (Refer to 23 - BODY/DOORS - REAR/INSIDE HANDLE ACTUATOR - INSTALLATION)

WINDOW REGULATOR - POWER

REMOVAL

(1) Remove the waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL)

(2) Remove the window switch from the door trim panel and reconnect it to the door wire harness.

(3) Raise the window to the position shown and remove the two nuts attaching the glass to the window regulator. (Fig. 11)

(4) Remove the stabilizer nut.

(5) Disengage the door glass from the regulator lift plate and position into the full up position.

(6) Secure the glass in the up position using a wood wedge or equivalent.

(7) Lower the regulator.

(8) Disconnect the electrical connector. (Fig. 12)

(9) Remove the lower regulator bolt and loosen the upper two. (Fig. 12)

(10) Slide the regulator up and out of the keyhole slots in the door panel.

(11) Remove the regulator through the hole in the inner door panel.

80d2e273

Fig. 11 GLASS POSITIONING

- 1 - SIGHT WINDOW
2 - STABILIZER NUT
3 - GLASS LIFT PLATE

INSTALLATION

(1) Install the regulator through the hole in the inner door panel.

(2) Position the regulator bolts into the keyhole slots and slide into place.

(3) Install the lower regulator bolt and tighten all three to 10 N-m (89 in. lbs.).

(4) Connect the electrical connector.

(5) Position the stabilizer, install the nut and tighten to 10 N-m (89 in. lbs.).

(6) Raise the regulator to the position shown in (Fig. 11).

(7) Remove the glass support and connect to the regulator lift plate.

(8) Install the glass nuts and tighten to 10 N-m (89 in. lbs.).

(9) Disconnect the window switch and install into the door trim panel.

WINDOW REGULATOR - POWER (Continued)

80d2f582

Fig. 12 WINDOW REGULATOR MOTOR

- 1 - REGULATOR BOLTS
- 2 - REGULATOR MOTOR
- 3 - ELECTRICAL CONNECTOR.

(10) Install the waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION)

WINDOW REGULATOR - MANUAL

REMOVAL

- (1) Remove the waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL)
- (2) Reinstall the window handle and raise the window to the position shown and remove the nuts. (Fig. 11)
- (3) Remove the stabilizer nuts. (Fig. 13)
- (4) Disengage the door glass from the regulator lift plate and position into the full up position.
- (5) Secure the glass in the up position using a wood wedge or equivalent.
- (6) Lower the regulator.
- (7) Remove the two back regulator bolts and loosen the front two.
- (8) Slide the regulator up and out of the keyhole slots in the door panel.
- (9) Remove the regulator through the hole in the inner door panel.

80d2c986

Fig. 13 WINDOW REGULATOR - MANUAL

- 1 - DOOR
- 2 - REGULATOR BOLTS (4)
- 3 - STABILIZER NUTS (2)
- 4 - REGULATOR

INSTALLATION

- (1) Install the regulator through the hole in the inner door panel.
- (2) Position the regulator bolts into the keyhole slots and slide into place.
- (3) Install the back regulator bolts and tighten all four to 10 N·m (89 in. lbs.).
- (4) Position the stabilizer, install the nuts and tighten to 10 N·m (89 in. lbs.).
- (5) Using the window handle raise the regulator to the position shown in (Fig. 11).
- (6) Remove the glass support and connect to the regulator lift plate.
- (7) Install the glass nuts and tighten to 10 N·m (89 in. lbs.).
- (8) Disconnect the window switch and install into the door trim panel.
- (9) Using the window handle raise the regulator to the position shown in (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION)

BODY SIDE MOLDINGS

REMOVAL

NOTE: Body side moldings are attached to the body panels with adhesive tape.

(1) Apply a length of masking tape on the body panel, parallel to the top edge of the molding and to one end to use as a guide for installation, if necessary.

(2) If temperature is below 21°C (70°F) warm molding with a heat lamp or gun. Do not exceed 52°C (120°F) when heating molding.

(3) Using a trim stick C-4755 or equivalent, remove and discard the molding from the outside of the body panel.

INSTALLATION

(1) Thoroughly clean all residue from the body side molding attachment area of the body panel.

(2) Wipe area with a clean lint free cloth moistened with a 50% solution of water and alcohol and wipe dry immediately with a dry lint free cloth.

(3) Apply new body side molding using the guide tape on the body panel and apply consistent and uniform pressure of approximately 40 p.s.i. over the entire surface of the molding.

BODY ISOLATORS

REMOVAL

(1) Loosen all cab to frame mounting bolts (six standard cab, eight quad cab). (Fig. 1)

(2) Remove the mounting bolts and rebound cushions

(3) Using a floor jack and block of wood under the cab sill, lift the body to gain access to the isolators.

(4) Remove the isolators.

(5) Install new isolators and repeat steps one through 4, for the opposite side.

BODY ISOLATORS (Continued)

80dc006c

Fig. 1 BODY ISOLATORS - TYPICAL

- 1 - CAB SILL
- 2 - ISOLATORS
- 3 - REBOUND CUSHION
- 4 - WASHER (REAR ISOLATOR ONLY)
- 5 - BOLTS
- 6 - REINFORCEMENT PLATE (REAR ISOLATOR ONLY)

INSTALLATION

- (1) For the rear isolators install the rebound cushions, washers, reinforcement plates and bolts. (Fig. 1)
- (2) Install the remaining rebound cushions and bolts.
- (3) Tighten the bolts to 81 N·m (60 ft. lbs.).

CARGO BOX

REMOVAL

- (1) Disconnect the fuel fill hose and vent hose. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL)
- (2) Disconnect the tail lamp wire harness.
- (3) Remove the cargo box bolts. (Fig. 2) or (Fig. 3)
- (4) Remove the cargo box.

INSTALLATION

- (1) Install the cargo box and install the bolts.
- (2) Tighten the bolts to 108 N·m (80 ft. lbs.).
- (3) Connect the fuel fill and vent hoses. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - INSTALLATION)
- (4) Connect the tail lamp wire harness.

80d21cc5

80d21d4f

Fig. 3 LONG CARGO BOX

- 1 - CARGO BOX
- 2 - FRAME
- 3 - BOLTS (4 PER SIDE)

CARGO BOX - TIE DOWN

REMOVAL

(1) Remove the bolts and remove the tie down cleat. (Fig. 4)

Fig. 4 TIE DOWN CLEAT

- 1 - BOLTS (2)
2 - CLEAT

INSTALLATION

- (1) Install the tie down cleat and install the bolts.
- (2) Tighten the bolts to 34 N·m (25 ft. lbs.).

COWL GRILLE

REMOVAL

- (1) Remove the wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL)
- (2) Disconnect the washer hose.
- (3) Remove the hood seal.
- (4) Remove the six push pin fasteners from the front of the grille. (Fig. 5)
- (5) Remove the two rear corner screws and remove the grilles.

INSTALLATION

- (1) Install the grill and install the two rear corner screws.
- (2) Install the six push pin fasteners along the front of the grille.
- (3) Install the hood seal.
- (4) Connect the washer hose.

Fig. 5 COWL GRILLE

- 1 - PUSH PIN FASTENERS (6)
2 - COWL GRILLE
3 - SCREWS (2)

(5) Install the wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION)

EXTERIOR NAME PLATES

REMOVAL

NOTE: Exterior name plates are attached to body panels with adhesive tape.

- (1) Apply a length of masking tape on the body, parallel to the top edge and one end of the name plate to use as a guide for installation, if necessary.
- (2) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating name plate.
- (3) Using a trim stick C-4755 or equivalent, remove and discard the name plate.

INSTALLATION

- (1) Thoroughly clean all residue from the name plate attachment area of the body panel.
- (2) Wipe area with a clean lint free cloth moistened with a 50% solution of water and alcohol and wipe dry immediately with a dry lint free cloth.
- (3) Remove protective cover from adhesive tape on back of name plate.
- (4) Position name plate properly on the body panel.
- (5) Apply consistent and uniform pressure over the entire surface of the name plate, with palm of hand.
- (6) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating name plate.

FRONT FENDER

REMOVAL

(1) Remove the antenna, if equipped. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - REMOVAL)

(2) Remove the battery tray, if required. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL)

(3) Remove the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL)

(4) Remove the headlamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL)

(5) Remove the wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - REMOVAL)

(6) Remove the inside and lower bolts. (Fig. 6)

(7) Remove the two bolts below the headlamp.

(8) Remove the hinge support bolt at the cowl.

(9) Remove the three bolts along the fender rail.

80d2ff31

Fig. 6 FRONT FENDER

- 1 - HOOD HINGE SUPPORT BOLT (1)
- 2 - HOOD HINGE
- 3 - INNER BOLT (1)
- 4 - FRONT BOLTS (2)
- 5 - LOWER BOLT INSERT
- 6 - FENDER
- 7 - UPPER BOLTS (3)

INSTALLATION

(1) Install the three bolts along the upper fender rail and tighten to 9 N·m (80 in. lbs.).

(2) Install the upper hinge support bolt at the cowl and tighten to 17 N·m (13 ft. lbs.).

(3) Install the two bolts below the headlamp and tighten to 9 N·m (80 in. lbs.).

(4) Install the inside and lower bolts and tighten to 17 N·m (13 ft. lbs.).

(5) Check the fender positioning and adjust as required by adding shims. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

(6) Install the wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - INSTALLATION)

(7) Install the headlamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION)

(8) Install the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION)

(9) Install the battery tray, if required. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION)

(10) Install the antenna, if required. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - INSTALLATION)

FUEL FILL DOOR

REMOVAL

(1) Open fill door and remove the bolts. (Fig. 7)

(2) Remove the door.

80d307a6

Fig. 7 FUEL FILL DOOR

- 1 - FUEL FILL DOOR
- 2 - BOLTS (2)

INSTALLATION

(1) Install the fuel fill door.

(2) Install the bolts and tighten to 9 N·m (80 in. lbs.).

GRILLE

REMOVAL

- (1) Open the hood.
- (2) Remove the six lower screws. (Fig. 8)
- (3) Remove the six upper nuts and separate the grille from the grille frame.

80d30b22

Fig. 8 GRILLE

- 1 - NUTS (6)
- 2 - HOOD
- 3 - GRILLE
- 4 - GRILLE FRAME
- 5 - SCREWS (6)

INSTALLATION

- (1) Position the grille onto the grille frame.
- (2) Install the six upper nuts.
- (3) Install the six lower screws.

GRILLE FRAME

REMOVAL

- (1) Remove the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL)
- (2) Remove the screws and remove the grille frame. (Fig. 9)

80d30b30

Fig. 9 GRILLE FRAME

- 1 - HOOD
- 2 - GRILLE FRAME
- 3 - SCREWS (6)

INSTALLATION

- (1) Install the grille frame and install the six screws.
- (2) Install the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION)

FRONT WHEELHOUSE SPLASH SHIELD

REMOVAL

- (1) Remove the three screws at the fender. (Fig. 10)
- (2) Remove the electrical connector push pin fastener.
- (3) Remove the five inside screws and remove the splash shield.

Fig. 10 FRONT SPLASH SHIELD

- 1 - FENDER RAIL
- 2 - FENDER
- 3 - SCREWS (8)
- 4 - WHEELHOUSE SPLASH SHIELD

INSTALLATION

- (1) Install the splash shield and position the front edge into the support bracket on the bumper.
- (2) Install the five inner screws.
- (3) Install the three screws at the fender.
- (4) Install the electrical connector push pin fastener.

REAR WHEELHOUSE SPLASH SHIELD

REMOVAL

- (1) Remove the screws and remove the shield. (Fig. 11)

INSTALLATION

- (1) Install the splash shield and install the screws.

Fig. 11 REAR SPLASH SHIELD

- 1 - CARGO BOX
- 2 - SCREWS (3)
- 3 - SPLASH SHIELD

SIDE VIEW MIRROR

REMOVAL

- (1) Remove the door trim panel as necessary to gain access to the mirror. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Disconnect the electrical connector and remove the nuts. (Fig. 12)
- (3) Squeeze the electrical connector tabs and remove the mirror. (Fig. 13)

Fig. 12 SIDE VIEW MIRROR

- 1 - MIRROR
- 2 - NUTS (3)
- 3 - ELECTRICAL CONNECTOR

SIDE VIEW MIRROR (Continued)

Fig. 13 MIRROR ELECTRICAL CONNECTOR

- 1 - DOOR
- 2 - MIRROR STUDS
- 3 - CONNECTOR TABS
- 4 - ELECTRICAL CONNECTOR

INSTALLATION

- (1) Install the mirror onto the door and engage the electrical connector tabs. (Fig. 13)
- (2) Install the nuts and tighten to 7 N·m (60 in. lbs.).
- (3) Install the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

UPPER RADIATOR CROSSMEMBER

REMOVAL

- (1) Remove the hood latch. (Refer to 23 - BODY/HOOD/LATCH - REMOVAL)
- (2) Remove the radiator and condenser bolts. (Fig. 14)
- (3) Remove the bolts and remove the crossmember. (Fig. 15)

INSTALLATION

- (1) Install the crossmember and install the bolts.
- (2) Tighten the bolts to 28 N·m (21 ft. lbs.).
- (3) Install the radiator and condenser bolts and tighten to 8 N·m (75 in. lbs.).
- (4) Install the hood latch. (Refer to 23 - BODY/HOOD/LATCH - INSTALLATION)

Fig. 14 CONDENSER/RADIATOR FASTENERS

- 3 - BOLTS (2)

SIDE VIEW MIRROR GLASS

REMOVAL

WARNING: ALWAYS WEAR EYE AND HAND PROTECTION WHEN SERVICING THE MIRROR ASSEMBLY. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY FROM BROKEN GLASS.

Standard Mirror

- (1) Position the mirror glass so that it's facing in toward the vehicle as far as possible. (Fig. 16)

SIDE VIEW MIRROR GLASS (Continued)

(2) Disengage the rear housing cover retaining tabs and remove the cover. (Fig. 17)

(3) Disengage the lower glass retaining tab to motor. (Fig. 18)

(4) Slide glass up and remove from motor.

(5) Disconnect the two heated mirror electrical connectors, if equipped.

Fig. 16 STANDARD MIRROR POSITION

- 2 - MIRROR HOUSING
- 3 - MIRROR GLASS

Fig. 17 STANDARD MIRROR HOUSING COVER

- 1 - MIRROR HOUSING COVER
- 2 - RETAINING TABS (3)

Tow Package Mirror

(1) Position the mirror in the out position. (Fig. 19)
 (2) Release the retaining clip and separate the glass.

(3) Disconnect the four heated glass electrical connectors, if equipped. (Fig. 20)

Fig. 18 STANDARD MIRROR RETAINING TAB

- 1 - MIRROR ASSEMBLY
- 2 - MIRROR GLASS LOWER RETAINING TAB

Fig. 19 TOW PACKAGE MIRROR POSITION

- 1 - MIRROR HOUSING ASSEMBLY
- 2 - MIRROR GLASS RETAINING CLIP
- 3 - MIRROR GLASS

INSTALLATION

Standard Mirror

(1) Connect the two heated mirror electrical connectors, if equipped. (Fig. 21)

(2) Position the mirror glass mounting holes over the four feet of the mirror motor and slide down. (Fig. 22)

(3) Engage the lower glass retaining tab to the motor. (Fig. 18)

(4) Position the rear housing cover and seat the retaining tabs fully. (Fig. 17)

Tow Package Mirror

(1) Make sure the retaining clip is seated in the closed position on the mirror glass.

SIDE VIEW MIRROR GLASS (Continued)

- 1 - MIRROR GLASS
- 2 - UPPER AND LOWER RETAINING CLIPS
- 3 - HEATED MIRROR ELECTRICAL CONNECTORS (IF EQUIPPED)
- 4 - MIRROR GLASS MOUNTING HOLES (4)

(2) Connect the heated mirror electrical connectors, if equipped.

NOTE: Pressure must be applied equally over the center portion of the mirror to engage the mirror glass retaining clip fully.

(3) Position the glass over the motor mounting and seat fully. Make sure the retaining clip seats fully.

REAR FENDER

REMOVAL

- (1) Remove the wheel house splash shield. (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL)
- (2) Disconnect the marker lamps electrical connectors.
- (3) Remove the tail lamp units. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP UNIT - REMOVAL)
- (4) Remove the two fender nuts. (Fig. 23)
- (5) Remove the rear inner nuts below the tail lamp. (Fig. 24)
- (6) Remove the two bolts at the rear bottom edge.
- (7) Remove the two bolts at the front bottom edge.
- (8) Remove the four inner nuts front edge. (Fig. 25)
- (9) Loosen bolts and loosen the two fender support brackets. (Fig. 26)

CAUTION: Mask off the surrounding box area to avoid damage to the painted surfaces.

(10) Lift the fender up off the support brackets and remove the fender.

INSTALLATION

CAUTION: Mask off the surrounding box area to avoid damage to the painted surfaces during installation.

REAR FENDER (Continued)

- 3 - BOLTS (3 PER BRACKET)

- (3) Install the two inner nuts along the rear edge of the fender below the tail lamp unit and tighten to 7 N·m (60 in. lbs.).
- (4) Tighten the six support bracket bolts and tighten to 11 N·m (8 ft. lbs.).
- (5) Install the bolts along lower edge of the fender and tighten to 7 N·m (60 in. lbs.).
- (6) Connect the marker lamps electrical connectors.
- (7) Install the wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - INSTALLATION)
- (8) Install the two nuts from within the tail lamp opening and tighten to 7 N·m (60 in. lbs.).
- (9) Install the tail lamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP UNIT - INSTALLATION)

HINGE

REMOVAL

NOTE: It is not necessary to remove the hood to replace one or both hinges. The hinges can be replaced one at a time.

(1) Remove the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL)

(2) Using a grease pencil or equivalent, mark the position of the hinge on the hood.

(3) Remove the fender support bolt. (Fig. 1)

(4) Remove the support cylinder. (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - REMOVAL)

(5) Remove the hood nuts.

(6) Remove the wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - REMOVAL)

(7) From inside the fender, remove the two hinge bolts. (Fig. 2)

(8) Slide the hinge forward and remove from the fender rail.

INSTALLATION

(1) Install the hinge and slide back into position on the fender rail.

(2) From inside the fender, install the two hinge bolts and tighten to 20 N·m (15 ft. lbs.).

(3) Install the hood nuts and line up the marks made previously.

(4) Tighten the nuts to 23 N·m (17 ft. lbs.).

(5) Install the support cylinder. (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - INSTALLATION)

(6) Install the fender support bolt and tighten to 11 N·m (8 ft. lbs.).

Fig. 1 HINGE/FENDER BOLT

- 1 - FENDER
- 2 - FENDER SUPPORT BOLT
- 3 - HINGE

(7) Check hood fit and adjust if required. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

(8) Install the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION)

(9) Install the wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - INSTALLATION)

HOOD

REMOVAL

(1) Open the hood.

(2) Using a grease pencil or equivalent, mark the position of the hinges on the hood.

(3) Remove the hood hinge nuts and remove the hood.

HOOD (Continued)

Fig. 2 HINGE

- 1 - A-PILLAR
- 2 - HINGE
- 3 - BOLTS (2)

(4) Remove the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL)

(5) Remove the hood lamp and ambient temperature sensor.

INSTALLATION

(1) Install the hood lamp and ambient temperature sensor.

(2) Install the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION)

(3) Install the hood and install the nuts.

(4) Line up the marks made previously and tighten the nuts to 23 N·m (17 ft. lbs.).

(5) Check the hood fit and adjust if required. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

LATCH**REMOVAL**

(1) Open the hood.

(2) Using a grease pencil or equivalent, mark the position of the latch on the radiator crossmember.

(3) Remove the bolts. (Fig. 3)

(4) Disconnect the hood latch cable and remove the latch.

INSTALLATION

(1) Connect the hood latch cable.

(2) Install the latch lining up the marks made previously and install the bolts.

(3) Tighten the bolts to 11 N·m (8 ft. lbs.).

(4) Check hood fit and adjust if required. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

Fig. 3 LATCH

- 1 - HOOD LATCH
- 2 - HOOD LATCH CABLE
- 3 - BOLTS (2)

**LATCH RELEASE CABLE/
HANDLE ASSEMBLY****REMOVAL**

(1) Remove the hood latch. (Refer to 23 - BODY/HOOD/LATCH - REMOVAL)

(2) Remove the batter tray. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL)

(3) Disconnect the three cable push pin fasteners.

(4) From inside the cab loosen the two handle screws and disconnect the handle from the instrument panel bracket.

(5) Separate the grommet at the cowl panel and remove cable through the cab.

INSTALLATION

(1) Route the cable/handle assembly through the cowl panel and install the grommet.

(2) Position the handle onto the instrument panel bracket and tighten the screws.

(3) Route the cable along the fender rails and install the three push pin fasteners.

(4) Install the latch. (Refer to 23 - BODY/HOOD/LATCH - INSTALLATION)

(5) Install the battery tray. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION)

**LATCH STRIKER /
SECONDARY CATCH****REMOVAL**

(1) Disconnect and remove the secondary release handle. (Fig. 4)

(2) Remove the two bolts and remove the striker/catch assembly.

LATCH STRIKER / SECONDARY CATCH (Continued)

80d31d43

Fig. 4 HOOD LATCH STRIKER/SECONDARY CATCH

- 1 - GRILLE
- 2 - LATCH STRIKER/SECONDARY CATCH
- 3 - BOLTS (2)
- 4 - SECONDARY CATCH RELEASE HANDLE
- 5 - GRILLE FRAME

INSTALLATION

- (1) Install the latch striker/secondary catch and install the bolts.
- (2) Tighten the bolts to 11 N·m (8 ft. lbs.).
- (3) Install the release handle and connect to the secondary catch.
- (4) Check the hood fit and adjust if required. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

SUPPORT CYLINDER

REMOVAL

NOTE: The support cylinders can be replaced one at a time.

- (1) Open the hood and support.

NOTE: Lift the clips only enough to release the ball studs. (Fig. 6)

- (2) Using a small flat bladed tool, or equivalent, release the upper retaining clips while pulling the ball socket away from the ball stud. (Fig. 5)

CAUTION: Do not pull the supports from the middle while removing.

- (3) Pulling at the ends only, remove the support cylinder.

- 4 - BALL STUD

80f70318

Fig. 6 UPPER SUPPORT CYLINDER RETAINING CLIP

- 1 - RETAINING CLIP
- 2 - BALL SOCKET
- 3 - BALL STUD

INSTALLATION

- (1) Make sure the retaining clips are seated into the ball socket fully.

CAUTION: Do not install the support cylinders by pressing at the center of the cylinder. Press the ends only.

- (2) Install the support cylinder over the ball studs with the thin end connected to the body side of the hinge and the retaining clips snapping into place.

CLUSTER BEZEL

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Remove the headlamp switch bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SWITCH BEZEL - REMOVAL)
- (2) Remove the center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)

- (3) Remove the two top screws. (Fig. 1)
- (4) Using a trim stick C-4755 or equivalent, separate the two lower clips.
- (5) Disengage the two top attachment bosses and remove the bezel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the cluster bezel over the cluster and seat the outer bosses over the posts on the left and right sides.

CLUSTER BEZEL (Continued)

Fig. 1 CLUSTER BEZEL

- 1 - INSTRUMENT PANEL
- 2 - SCREWS (2)
- 3 - CLUSTER BEZEL
- 4 - CLIP FASTENERS (2)

- (2) Snap the top edge of the bezel into place fully.
- (3) Seat the two bottom clips fully.
- (4) Install the two top screws.
- (5) Install the center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION)
- (6) Install the headlamp switch bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SWITCH BEZEL - INSTALLATION)

ASH RECEIVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Open ash receiver and place hand inside. (Fig. 2)
- (2) Apply force with an **abrupt** downward motion and roll rearward. (Fig. 3)
- (3) Dislodge and roll ash receiver out of panel to remove.

Fig. 2 ASH RECEIVER

CUP HOLDER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Remove the center bezel.(Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
- (2) Remove the airbag control module trim cover. (Fig. 4)
- (3) Open the cupholder and fold down the inner panel.
- (4) Remove the two inner screws. (Fig. 5)
- (5) Remove the remaining two top and bottom screws and remove the cup holder. (Fig. 6)

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING

Fig. 5 CUPHOLDER - INNER FASTENERS

- 1 - CUPHOLDER

COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CUP HOLDER (Continued)

80d3cea4

Fig. 6 CUPHOLDER - OUTER FASTENERS

- 1 - SCREWS (4)
2 - CUPHOLDER

- (1) Install the cupholder and install the two upper screws from the left to the right.
- (2) Install the lower two screws from the left to the right.
- (3) Fold down the inner cover and install the two inner screws.
- (4) Install the center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION)
- (5) Install the airbag control module trim cover.

GLOVE BOX

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Partially open the glove box.

- (2) From the inside of the box press down on the rearward edge of the bin and lower the glove box fully past the stops.

- (3) Lift the box assembly off of the hinges and remove.

INSTALLATION

- (1) Engage the glove box hinges and partially close.

- (2) From the inside of the box press down on the rearward edge of the bin and raise the glove box fully past the stops.

- (3) Check for proper glove box operation.

GLOVE BOX LATCH

REMOVAL

- (1) Remove the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL)

- (2) Remove the 11 screws and separate the box and inner panel from the outer door.

- (3) Remove the two latch screws and remove the latch.

INSTALLATION

- (1) Install the latch and install the two screws.

- (2) Install the door inner cover and box and install the 11 screws.

- (3) Install the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION)

INSTRUMENT PANEL ASSEMBLY

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

INSTRUMENT PANEL ASSEMBLY (Continued)

(1) Remove the left a-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM/GRAB HANDLE - REMOVAL)

(2) Remove the top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL)

(3) Disconnect the headliner harness electrical connector at the a-pillar.

(4) Using a trim stick C-4755 or equivalent, from the notch on the bottom, remove the left side cover. (Fig. 20)

(5) Remove the steering column. (Refer to 19 - STEERING/COLUMN - REMOVAL)

(6) Remove the two bolts at the column support bracket. (Fig. 7)

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the instrument panel assembly in vehicle.

(2) Route the park brake release rod through the instrument panel. (Fig. 16)

Fig. 16 BRAKE RELEASE ROD

- 1 - PARK BRAKE RELEASE HANDLE
- 2 - PARK BRAKE RELEASE ROD
- 3 - INSTRUMENT PANEL

(3) Install the instrument panel onto the left side guide pin and the right side guide hook.

(4) Install the left side mounting bolts and tighten to 12 N·m (9 ft. lbs.).

(5) Install the instrument panel drivers side bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL DRIVERS SIDE BEZEL - INSTALLATION)

(6) Install the left cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)

(7) Connect the headliner harness electrical connector at the a-pillar.

INSTRUMENT PANEL ASSEMBLY (Continued)

(8) Install the left a-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

(9) Position the left end cap and seat the attachment clips fully.

(10) Install the right side mounting bolts on the a-pillar and one right mounting bolt on the cowl side panel and tighten to 12 N·m (9 ft. lbs.).

(11) Install the right a-pillar trim panel. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

(12) Position the right end cap and seat the attachment clips fully.

(13) Install the one HVAC mounting screw.

(14) Connect the radio antenna.

(15) Connect the two electrical connectors at the right cowl panel.

(16) Install the right cowl trim cover. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)

(17) Connect the air bag control module electrical connector.

(18) Install the center bracket bolts and tighten to 12 N·m (9 ft. lbs.).

(19) Install the floor console, if equipped. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

(20) Install the air bag control module cover, if equipped.

(21) Connect the park brake release handle actuator rod.

(22) Install the hood release handle and tighten the screws.

(23) Install the two bolts at the column support bracket and tighten to 14 N·m (10 ft. lbs.).

(24) Install the steering column. (Refer to 19 - STEERING/COLUMN - INSTALLATION)

(25) Connect the wire harness electrical connectors above the brake pedal.

(26) Install the two top instrument panel bolts and tighten to 12 N·m (9 ft. lbs.).

(27) Install the four top instrument panel screws.

(28) Install the instrument panel top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION)

INSTRUMENT PANEL HEADLAMP SWITCH BEZEL

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SER-

VICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Using a trim stick C-4755 or equivalent, release the top clips on the steering column opening cover and the lower drivers side bezel.

(2) Using a trim stick C-4755 or equivalent, release the switch bezel. (Fig. 17)

(3) Disconnect the electrical connector and remove the bezel.

80d3f7d8

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Connect the electrical connector.

INSTRUMENT PANEL HEADLAMP SWITCH BEZEL (Continued)

(2) Position the switch bezel and seat the attachment clips fully.

(3) Seat the clips on the steering column opening cover and the lower drivers side bezel fully.

INSTRUMENT PANEL CENTER BEZEL

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CAUTION: When removing and installing the center bezel, use tape or other suitable material to protect the cupholder and ash receiver from damage.

- (1) Disconnect and isolate the negative battery cable.
- (2) Remove the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL)
- (3) Open the ashtray and cup holder.
- (4) Remove the one center bezel retaining screw (Fig. 18).

CAUTION: Extreme care must be taken not to scratch the ashtray door while removing the instrument panel center bezel. Apply masking tape to the ashtray door if the center bezel is not being completely removed from the instrument panel.

- (5) Using a trim stick C-4755 or equivalent, gently pry the center bezel free from the instrument panel.
- (6) Working behind the center bezel, disconnect all electrical connectors and remove the bezel.

80d31750

Fig. 18 CENTER BEZEL

- 1 - INSTRUMENT PANEL
- 2 - CENTER BEZEL
- 3 - SCREW

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CAUTION: When removing and installing the center bezel, use tape or other suitable material to protect the cupholder and ash receiver from damage.

- (1) Working behind the center bezel, connect all electrical connectors.
- (2) Gently install the center bezel on the instrument panel by pushing straight in and seat the attachment clips fully.
- (3) Install the one center bezel screw.
- (4) Install the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION)
- (5) Connect the negative battery cable.

INSTRUMENT PANEL DRIVER SIDE BEZEL

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Using a trim stick C-4755 or equivalent, at notch in the bottom, remove the drivers side endcap.
- (2) Remove the drivers side cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL)
- (3) Remove the two screws. (Fig. 19)
- (4) Using a trim stick C-4755 or equivalent, release the top clips and tilt the bezel down.
- (5) Disconnect the adjustable pedal switch electrical connector, if equipped.
- (6) Lower the bezel down fully and remove from the lower hooks.

Fig. 19 LOWER DRIVERS SIDE BEZEL

- 1 - SCREWS (2)
- 2 - ADJUSTABLE PEDAL SWITCH (if equipped)
- 3 - PEDAL SWITCH ELECTRICAL CONNECTOR
- 4 - BEZEL

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the bezel onto the lower hooks and lift up.
- (2) Connect the adjustable pedal switch electrical connector, if equipped.
- (3) Seat the upper attachment clips fully.
- (4) Install the two screws.
- (5) Position the endcap and seat fully.
- (6) Install the drivers side cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)

INSTRUMENT PANEL TOP COVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Using a trim stick C-4755 or equivalent, pry up on the rear of the top cover and release the attachment clips.
- (2) Pull the top cover backwards to release the remaining clips and remove the cover.

INSTRUMENT PANEL TOP COVER (Continued)

Fig. 20 INSTRUMENT PANEL COVERS

- 1 - TOP COVER
- 2 - INSTRUMENT PANEL
- 3 - AIR BAG MODULE COVER
- 4 - END CAP

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the top cover and fully seat the front clips by pushing the cover forward and down.
- (2) Fully seat the rear clips.

INSTRUMENT PANEL LOWER SURROUND

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR

TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Using a trim stick C-4755 or equivalent, at notch in the bottom, remove the passenger side end-cap.
- (2) Remove the passenger side cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL)
- (3) Remove the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL)
- (4) Remove the cup holder, if equipped. (Refer to 23 - BODY/INSTRUMENT PANEL/CUP HOLDER - REMOVAL)
- (5) Remove the storage bin, if equipped. (Refer to 23 - BODY/INSTRUMENT PANEL/STORAGE BIN - REMOVAL)
- (6) Remove the ash receiver. (Refer to 23 - BODY/INSTRUMENT PANEL/ASH RECEIVER - REMOVAL)
- (7) Remove the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL)
- (8) Remove the 12 screws around the glove box opening.
- (9) Remove the nine remaining screws around the cup holder/storage bin and ash receiver area and remove the surround.
- (10) Disconnect the 12V power outlet electrical connector.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Install the surround and install all 21 screws.
- (2) Install the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION)

INSTRUMENT PANEL LOWER SURROUND (Continued)

(3) Install the storage bin, if equipped. (Refer to 23 - BODY/INSTRUMENT PANEL/STORAGE BIN - INSTALLATION)

(4) Install the cup holder, if equipped. (Refer to 23 - BODY/INSTRUMENT PANEL/CUP HOLDER - INSTALLATION)

(5) Install the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION)

(6) Install the ash receiver. (Refer to 23 - BODY/INSTRUMENT PANEL/ASH RECEIVER - INSTALLATION)

(7) Install the passenger side cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)

(8) Position the passenger side end cap and seat fully.

STEERING COLUMN OPENING COVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Remove the two lower screws. (Fig. 21)
- (2) Using a trim stick C-4755 or equivalent, release the upper clips and remove the cover.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE

- 1 - SCREWS (2)
- 2 - COVER

TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the cover and seat the upper clips fully.
- (2) Install the two lower screws.

STEERING COLUMN OPENING SUPPORT BRACKET

REMOVAL

- (1) Remove the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL)
- (2) Remove the two screws and remove the diagnostic connector.
- (3) Loosen the screws and remove the hood release handle from the bracket.
- (4) Remove the two bracket screws and slide upward off the locating tabs to remove. (Fig. 22)

INSTALLATION

- (1) Position the bracket onto the locating tabs and slide down.
- (2) Install the two screws.
- (3) Install the diagnostic connector and install the two screws.
- (4) Install the hood release handle and tighten the screws.

STEERING COLUMN OPENING SUPPORT BRACKET (Continued)

(5) Install the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION)

STORAGE BIN

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)

- (2) Remove the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (3) Remove the four screws and remove the bin. (Fig. 23)

**Fig. 23 STORAGE BIN**

- 1 - SCREWS (4)
- 2 - STORAGE BIN

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Install the storage bin and install the four screws from left to right.
- (2) Install the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)
- (3) Install the center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION)

INTERIOR

CAUTION

CAUTION:: Do not attempt to remove interior trim panels/moldings without first removing the necessary adjacent panels. To avoid damaging the panels, ensure that all the screws and clips are removed before attempting to remove an interior trim panel/molding. Trim panels are somewhat flexible but can be damaged if handled improperly.

4WD FLOOR SHIFT BOOT

REMOVAL

- (1) Using a small pry bar or equivalent, remove the insert, the nut and remove the shifter knob. (Fig. 2)
- (2) Using a trim stick C-4755 or equivalent, pry up the boot from the console. (Fig. 1)

INSTALLATION

- (1) Position the shift boot over the shifter lever fully seat onto the console.

4WD FLOOR SHIFT BOOT (Continued)

- 4 - BOLTS (2)

80d3ffda

Fig. 2 SHIFTER KNOB

- 1 - SHIFTER KNOB
- 2 - INSERT
- 3 - NUT

- (2) Install the shifter knob and nut and tighten to 27 N·m (20 ft. lbs.).
- (3) Position the insert and seat into the knob fully.

A-PILLAR TRIM/GRAB HANDLE

REMOVAL

- (1) Open the trim plugs and remove the bolts. (Fig. 3)
- (2) Remove the a-pillar trim/grab handle from the a-pillar.

INSTALLATION

- (1) Position the bottom a-pillar locating tabs and install the a-pillar trim.
- (2) Install the bolts and tighten to 6 N·m (55 in. lbs.).
- (3) Close the trim plugs.

B-PILLAR LOWER TRIM

REMOVAL

- (1) Remove the upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL)
- (2) Remove the cowl trim. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL)

STANDARD CAB

- (1) Remove the shoulder belt anchor bolt.
- (2) Using a trim stick C-4755 or equivalent, remove the lower b-pillar trim. (Fig. 4)

QUAD CAB

- (1) Remove the rear door sill trim. (Refer to 23 - BODY/INTERIOR/REAR DOOR SILL TRIM COVER - REMOVAL)
- (2) Using a trim stick C-4755 or equivalent, remove the lower b-pillar trim.

B-PILLAR LOWER TRIM (Continued)

Fig. 5 LOWER B-PILLAR TRIM - QUAD CAB

- 1 - SEAT BELT
- 2 - SEAT BELT SLOT
- 3 - LOWER B-PILLAR TRIM

INSTALLATION

QUAD CAB

- (1) Route the shoulder belt through the slot in the trim.
- (2) Position the trim and seat the attachment clips fully.
- (3) Install the rear door sill trim. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM COVER - INSTALLATION)

STANDARD CAB

- (1) Position the trim and seat the attachment clips fully.
- (2) Install the seat belt anchor and bolt and tighten to 40 N·m (30 ft. lbs.).

BOTH BODY STYLES

- (1) Install the cowl trim. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)
- (2) Install the upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION)

B-PILLAR UPPER TRIM

REMOVAL

- (1) Remove the seat belt turning loop. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT TURNING LOOP ADJUSTER - REMOVAL)
- (2) Open the trim plugs and remove the grab handle bolts, if equipped. (Fig. 6)
- (3) Using a trim stick C-4755 or equivalent, remove the upper b-pillar trim. (Fig. 7) or (Fig. 8)

INSTALLATION

- (1) Position the upper b-pillar trim and seat the attachment clips fully.
- (2) Install the grab handle bolts and tighten to 6 N·m (55 in. lbs.).
- (3) Close the grab handle trim plugs.
- (4) Install the seat belt turning loop. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT TURNING LOOP ADJUSTER - INSTALLATION)

CARPETS AND FLOOR MATS

REMOVAL

- (1) Remove the front seats. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)
- (2) Remove the rear seats, if equipped. (Refer to 23 - BODY/SEATS/SEAT - REAR - REMOVAL)

(3) Remove the floor console, if equipped. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(4) Remove the lower b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)

(5) On quad cab models, remove the lower seat belt anchor next to the b-pillar.

(6) Using a trim stick C-4755 or equivalent, remove the rear cup holder, if equipped.

(7) Remove the jack assembly.

(8) Remove the carpet.

INSTALLATION

(1) Install the carpet.

(2) Install the jack assembly.

(3) Install the rear cup holder, if equipped.

(4) Install the lower b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)

(5) On quad cab models, install the lower seatbelt anchor bolt next to the b-pillar and tighten to 40 N·m (30 ft. lbs.).

(6) Install the floor console, if equipped. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

(7) Install the rear seats, if equipped. (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION)

(8) Install the front seats. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION)

COAT HOOK

REMOVAL

(1) Using a trim stick C-4755 or equivalent, pry down the release clip and remove the hook. (Fig. 9)

80d40e31

Fig. 9 COAT HOOK

- 3 - HEADLINER

80d40b4e

Fig. 10 COWL/SILL TRIM PANEL

- 1 - COWL TRIM PANEL
- 2 - CLIP INSERTS
- 3 - DOOR SILL

INSTALLATION

(1) Snap the coat hook into the sheet metal and seat the base of the coat hook fully.

(2) Push the upper portion in until it snaps or seats to the base.

COWL TRIM

REMOVAL

(1) Using a trim stick C-4755 or equivalent, remove the cowl trim panel. (Fig. 10)

INSTALLATION

(1) Position the cowl trim and seat the attachment clips fully.

C-PILLAR LOWER TRIM

REMOVAL

(1) Remove the upper c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)

(2) Remove the seat belt anchor bolt. (Fig. 11)

(3) Using a trim stick C-4755 or equivalent, remove the lower c-pillar trim.

(4) Pull seat belt out of the trim panel through the slot provided.

80d40f7a

- 5 - SEAT BELT
- 6 - SEAT BELT ANCHOR

C-PILLAR LOWER TRIM (Continued)

INSTALLATION

- (1) Route the shoulder belt through the slot in the trim.
- (2) Position the trim and seat the attachment clips fully.
- (3) Install the seat belt anchor bolt and tighten to 40 N·m (30 ft. lbs.).
- (4) Install the upper c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR UPPER TRIM - INSTALLATION)

C-PILLAR UPPER TRIM

REMOVAL

- (1) Remove the seat belt turning loop. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT TURNING LOOP ADJUSTER - REMOVAL)
- (2) Using a trim stick C-4755 or equivalent, remove the upper c-pillar trim. (Fig. 11)

INSTALLATION

- (1) Position the upper c-pillar trim and seat the attachment clips fully.
- (2) Install the seat belt turning loop. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT TURNING LOOP ADJUSTER - INSTALLATION)

FLOOR CONSOLE

REMOVAL

- (1) Remove the 4WD shifter boot. (Refer to 23 - BODY/INTERIOR/4WD FLOOR SHIFT BOOT - REMOVAL)
- (2) Using a trim stick C-4755 or equivalent, pry up the transmission shifter boot from the console.
- (3) Remove the transmission shifter extension.
- (4) Remove the console inserts. (Fig. 12)
- (5) Remove and discard the three bolts. (Fig. 13)
- (6) Lift up on the back and remove the console.

INSTALLATION

- (1) Position the front of the console up under the instrument panel.
- (2) Lower the back of the console and install three new screws.
- (3) Install the inserts.
- (4) Install the transmission shifter extension.
- (5) Position the transmission shifter boot in place and seat the attachment clips fully.
- (6) Install the 4WD shifter boot. (Refer to 23 - BODY/INTERIOR/4WD FLOOR SHIFT BOOT - INSTALLATION)

HEADLINER

REMOVAL

- (1) Remove the a-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)
- (2) Remove the upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL)
- (3) Remove the upper c-pillar trim, if equipped. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)
- (4) Remove the coat hooks. (Refer to 23 - BODY/INTERIOR/COAT HOOK - REMOVAL)
- (5) Disconnect the headliner harness electrical connector at the left a-pillar.
- (6) Remove the dome lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - REMOVAL)
- (7) Remove the overhead console. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL)
- (8) Remove the sun visors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL)
- (9) Remove the sun visor supports. (Refer to 23 - BODY/INTERIOR/SUN VISOR SUPPORT - REMOVAL)
- (10) Lower the headliner and disconnect the center high mounted stop light.
- (11) Lower the front of the headliner down to the floor just in front of the instrument panel and remove through the passenger door.

INSTALLATION

- (1) Install the headliner into the vehicle through the passenger door.
- (2) Raise the headliner and insert the right side above right side pillar trim pieces.
- (3) Connect the center high mounted stop light electrical connector.
- (4) Install the sun visor supports. (Refer to 23 - BODY/INTERIOR/SUN VISOR SUPPORT - INSTALLATION)
- (5) Install the coat hooks. (Refer to 23 - BODY/INTERIOR/COAT HOOK - INSTALLATION)
- (6) Install the sun visors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION)
- (7) Install the overhead console. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION)
- (8) Install the dome lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - INSTALLATION)
- (9) Connect the headliner harness electrical connector at the left a-pillar.
- (10) Install the upper c-pillar trim, if equipped. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)

(11) Install the upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION)

(12) Install the upper a-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

B-PILLAR GRAB HANDLE

REMOVAL

- (1) Open the trim plugs and remove the bolts. (Fig. 14)
- (2) Remove the grab handle.

80d4090f

Fig. 14 GRAB HANDLE

- 1 - GRAB HANDLE
- 2 - TRIM PLUGS
- 3 - BOLTS

INSTALLATION

- (1) Install the grab handle and install the bolts.
- (2) Tighten the bolts to 6 N·m (55 in. lbs.) and install the trim plugs.

REAR CAB BACK PANEL TRIM

REMOVAL

- (1) Remove the child seat tethers, if equipped. (Refer to 8 - ELECTRICAL/RESTRAINTS/CHILD TETHER - REMOVAL)
- (2) Remove the screws and remove the utility hooks/bin latch, if equipped. (Fig. 15)

REAR CAB BACK PANEL TRIM (Continued)

(3) Using a trim stick C-4755 or equivalent, remove the center seat belt trim bezel, if equipped.

(4) On quad cab models, remove the left lower c-pillar trim panel. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)

(5) On standard cab models, remove the left lower b-pillar trim panel. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)

(6) Remove the push pin fasteners, if equipped, and remove the back panel trim. (Fig. 16) or (Fig. 17)

80d45fb0

Fig. 15 UTILITY HOOK/STORAGE BIN LATCH

- 1 - SCREW
- 2 - UTILITY HOOK
- 3 - UTILITY HOOK COVER
- 4 - COVER LOCK TAB

INSTALLATION

(1) Position the back panel trim behind the right pillar trim.

(2) Route the center belt and trim bezel through the back panel, if equipped.

(3) On standard cab models, install the left lower b-pillar trim panel. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)

(4) On quad cab models, install the left lower c-pillar trim panel. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)

(5) Position the center belt trim bezel, if equipped, and seat the attachment clips fully.

(6) Install the utility hooks/bin latch and screws, if equipped.

(7) Install the child seat tethers, if equipped. (Refer to 8 - ELECTRICAL/RESTRAINTS/CHILD TETHER - INSTALLATION)

REAR VIEW MIRROR

REMOVAL

(1) If equipped, disconnect mirror harness connector.

(2) Loosen the mirror base setscrew (Fig. 18).

(3) Slide the mirror base upward and off the bracket.

REAR VIEW MIRROR (Continued)

Fig. 18 REAR VIEW MIRROR

- 1 - CONNECTOR
2 - SCREW
3 - REAR VIEW MIRROR
4 - SUPPORT BUTTON
5 - WINDSHIELD

80b3c5eb

INSTALLATION

INSTALLATION

- (1) Position the mirror base at the bracket and slide it downward onto the support bracket (Fig. 18).
- (2) Tighten the setscrew 1 N·m (15 in. lbs.) torque.
- (3) If equipped, connect mirror harness connector.

INSTALLATION - REAR VIEW MIRROR
SUPPORT BRACKET

- (1) Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
- (2) Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
- (3) Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
- (4) Apply accelerator to the surface on the bracket according to the following instructions:
 - (a) Crush the vial to saturate the felt applicator.
 - (b) Remove the paper sleeve.
 - (c) Apply accelerator to the contact surface on the bracket.
 - (d) Allow the accelerator to dry for five minutes.
 - (e) Do not touch the bracket contact surface after the accelerator has been applied.
- (5) Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.
- (6) Install the bracket according to the following instructions:

- (a) Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
- (b) Apply an even coat of adhesive to the contact surface on the bracket.
- (c) Align the bracket with the marked position on the windshield glass.
- (d) Press and hold the bracket in place for at least one minute.

NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

(7) Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.

(8) Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

SUN VISOR

REMOVAL

- (1) Remove the screws at the visor pivot and remove the visor.

INSTALLATION

- (1) Install the visor and install the screws at the visor pivots.

SUN VISOR SUPPORT

REMOVAL

- (1) Using a trim stick C-4755 or equivalent, pry down the release clip and remove the hook. (Fig. 19)

80d44382

Fig. 19 VISOR SUPPORT

- 1 - VISOR SUPPORT
2 - HEADLINER
3 - RELEASE CLIP

SUN VISOR SUPPORT (Continued)

INSTALLATION

(1) Snap the visor support into the sheet metal and seat the release clip fully.

BODY VENT

REMOVAL

(1) Remove the cab back panel trim. (Refer to 23 - BODY/INTERIOR/REAR CAB BACK PANEL TRIM - REMOVAL)

(2) While holding the vent, press the tabs to release the vent into the cab back panel. (Fig. 20)

(3) Twist the vent and remove through the vent hole.

Fig. 20 BODY VENT

- 1 - RETAINER TABS
- 2 - BODY VENT
- 3 - CAB BACK PANEL

INSTALLATION

(1) Position the vent into the vent hole in the cab back panel.

(2) Twist the vent and pull it into the hole frame and seat the tabs fully.

(3) Install the cab back panel trim. (Refer to 23 - BODY/INTERIOR/REAR CAB BACK PANEL TRIM - INSTALLATION)

REAR DOOR SILL TRIM COVER

REMOVAL

(1) Using a trim stick C-4755 or equivalent, pry up the sill trim and remove. (Fig. 21)

80d40ef2

Fig. 21 REAR DOOR SILL TRIM

- 1 - SILL TRIM
- 2 - REAR DOOR SILL

INSTALLATION

(1) Position the sill trim and seat the attachment clips fully.

LOAD FLOOR

REMOVAL

(1) Fold the rear seat cushion up.

(2) Remove the rear nuts in each corner. (Fig. 22)

(3) Fold the load floor up, remove the front bolts and remove the tray. (Fig. 23)

80d43b01

Fig. 22 REAR LOAD FLOOR - REAR FASTENERS

- 1 - REAR SEAT CUSHION
- 2 - NUTS (2)
- 3 - STOWAGE TRAY

LOAD FLOOR (Continued)

Fig. 23 REAR LOAD FLOOR - TYPICAL

- 1 - REAR STORAGE BIN
- 2 - LOAD FLOOR
- 3 - BOLTS (2)
- 4 - SUPPORT CYLINDER

INSTALLATION

- (1) Install the load floor and install the bolts.
- (2) Tighten the bolts to 40 N·m (30 ft. lbs.).
- (3) Fold the load floor down and install the nuts.
- (4) Tighten the nuts to 25 N·m (18 ft. lbs.).

LOAD FLOOR SUPPORT CYLINDER

REMOVAL

- (1) Open the load floor.
- (2) Remove the snap clips and retaining pins. (Fig. 24)
- (3) Remove the support cylinder.

Fig. 24 LOAD FLOOR SUPPORT CYLINDER

- 1 - RETAINING PINS/CLIPS (2)
- 2 - LOAD FLOOR
- 3 - SUPPORT CYLINDER

INSTALLATION

- (1) Install the support cylinder with the thin end down.
- (2) Install the retaining pins and clips.

INTERIOR COLORS

INTERIOR COLOR	DAIMLERCHRYSLER CODE
Taupe	L5
Dark Slate Gray	DV

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Vehicle Certification Label (Refer to **VEHICLE DATA/VEHICLE INFORMATION/VEHICLE CERTIFICATION LABEL - DESCRIPTION**) or the Body Code Plate (Refer to **VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION**). The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers. (Refer to 23 - **BODY/PAINT - SPECIFICATIONS**)

BASECOAT/CLEARCOAT FINISH

DESCRIPTION

The original equipment finish is a multi step process that involves cleaning, applying electro deposition (E-coat), anti-chip primer, basecoat, and clearcoat steps.

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clear coat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

BASECOAT/CLEARCOAT FINISH (Continued)

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

(5) On vehicles without clearcoat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clearcoat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

PAINT TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use MOPAR® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION) for Body Code Plate information.

WARNING: USE AN OSHA APPROVED RESPIRATOR AND SAFETY GLASSES WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

STANDARD PROCEDURE - PAINT TOUCH-UP

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with MOPAR® Tar/Road Oil Remover or equivalent, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.

WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT. AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

FINESSE SANDING/BUFFING & POLISHING

DESCRIPTION

CAUTION: Do not remove more than .5 mils of clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.

Use a Paint Thickness Gauge #PR-ETG-2X or equivalent to determine film thickness before and after the repair.

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CENTER SEAT

REMOVAL

NOTE: Do not reuse the seat fasteners, always replace with new ones.

- (1) Remove and discard the front bolts. (Fig. 1)

- (2) Position the seats forward, remove the rear bolts and discard.

- (3) Disconnect the 12v power supply electrical connector, if equipped. (Fig. 2)

- (4) Fold the seat backs forward and roll the seat assembly back in the vehicle.

- (5) Remove the nuts attaching the center seat to the drivers seat and the passenger seat and discard. (Fig. 3)

CENTER SEAT (Continued)

(6) Roll the seat assembly forward and remove the center seat portion.

Fig. 1 FRONT SEAT ASSEMBLY

INSTALLATION

NOTE: Do not reuse the seat fasteners, always replace with new ones.

Fig. 3 REAR ATTACHMENTS

- 1 - 12V POWER SUPPLY HARNESS
- 2 - CENTER SEAT STORAGE BIN
- 3 - FRONT SEAT TRACKS
- 4 - REAR NUTS (4)

(1) Install the center seat and roll the seat assembly back in the vehicle.

(2) Install new nuts attaching the center seat to the drivers and passenger seat.

(3) Tighten the nuts to 25 N·m (18 ft. lbs.).

(4) Roll the seat assembly forward and install new rear bolts.

(5) Connect the 12v power supply electrical connector, if equipped.

(6) Tighten the rear bolts to 40 N·m (30 ft. lbs.).

(7) Fold the seat backs up and slide the seats to the rear.

(8) Install new front bolts and tighten to 28 N·m (21 ft. lbs.).

CENTER ARMREST / SEAT BACK

REMOVAL

NOTE: Do not reuse the seat fasteners, always replace with new ones.

(1) Remove the center seat. (Refer to 23 - BODY/SEATS/SEAT - CENTER - REMOVAL)

(2) Disconnect the storage bin/cushion cover j-straps and position aside.

(3) Remove and discard the hinge bolts and separate the seat back from the storage bin/cushion. (Fig. 4)

CENTER ARMREST / SEAT BACK (Continued)

80d1ec70

Fig. 4 CENTER SEAT BACK HINGES

- 1 - STORAGE BIN/CUSHION COVERING
- 2 - SEAT BACK HINGE BOLTS (4)
- 3 - STORAGE BIN/CUSHION FRAME

INSTALLATION

NOTE: Do not reuse the seat fasteners, always replace with new ones.

- (1) Install the seat back onto the storage bin/cushion and install new hinge bolts.
- (2) Tighten the hinge to storage bin/cushion bolts to 25 N·m (18 ft. lbs.).
- (3) Connect the storage bin/cushion cover j-straps.
- (4) Install the center seat. (Refer to 23 - BODY/SEATS/SEAT - CENTER - INSTALLATION)

CENTER SEAT BACK INERTIA HINGE COVER

REMOVAL

NOTE: Free pivot hinge cover is removed with the free pivot hinge. (Refer to 23 - BODY/SEATS/CENTER SEAT BACK HINGE - REMOVAL)

- (1) For the inertia hinge cover disconnect the zip strip. (Fig. 5)
- (2) Position aside the storage bin/cushion cover.
- (3) Remove the pivot bolt.
- (4) Open the hinge cover at the bottom and remove the hinge cover. (Fig. 6)

INSTALLATION

NOTE: Free pivot hinge cover is installed with the free pivot hinge. (Refer to 23 - BODY/SEATS/CENTER SEAT BACK HINGE - INSTALLATION)

CENTER SEAT BACK INERTIA HINGE COVER (Continued)

- (1) Position the hinge cover over the hinge and close over the lock tabs.
- (2) Install the pivot bolt and tighten to 10 N·m (89 in. lbs.).
- (3) Reposition the storage bin/cushion cover.
- (4) Connect the zip strip.

CENTER SEAT BACK HINGE

REMOVAL

NOTE: Do not reuse the seat fasteners, always replace with new ones.

- (1) Remove the seat back. (Refer to 23 - BODY/ SEATS/CENTER ARMREST / SEAT BACK - REMOVAL)

Free Pivot Hinge/Cover

- (1) Disconnect the storage bin/cushion cover j-strap and position aside.
- (2) Remove and discard the pivot bolt. (Fig. 7)
- (3) Remove the hinge spacer. (Fig. 8)
- (4) Open the hinge cover flap and remove the wire harness, if equipped. (Fig. 9)
- (5) Remove the cover from the hinge.

CENTER SEAT BACK HINGE (Continued)

Inertia Hinge

(1) Remove the seat back inertia hinge cover. (Refer to 23 - BODY/SEATS/CENTER SEAT BACK INERTIA HINGE COVER - REMOVAL)

(2) Remove and discard the inertia hinge bolts and remove the hinge. (Fig. 10)

80d2045c

Fig. 10 INERTIA HINGE BOLTS

- 1 - SEAT BACK BOLTS
2 - CENTER SEAT BACK
3 - INERTIA HINGE

INSTALLATION

NOTE: Do not reuse the seat fasteners, always replace with new ones.

Free Pivot Hinge/Cover

(1) Position the pivot hinge cover over the pivot hinge and install the 12v power supply harness into the channel, if equipped.

(2) Close the hinge cover flat and position the spacer into place.

(3) Align the stop pin with the spacer and hinge and install the assembly onto the seat back.

(4) Install a new pivot bolt and tighten to 25 N·m (18 ft. lbs.)

Inertia Hinge

(1) Install the inertia hinge onto the center seat back and install new bolts.

(2) Tighten the bolts to 25 N·m (18 ft. lbs.).

(3) Install the seat back inertia hinge covers. (Refer to 23 - BODY/SEATS/CENTER SEAT BACK INERTIA HINGE COVER - INSTALLATION)

(1) Install the center seat back. (Refer to 23 - BODY/SEATS/CENTER ARMREST / SEAT BACK - INSTALLATION)

CENTER SEAT BACK LID**REMOVAL**

(1) Open the center armrest/seat back.

(2) Remove the four screws attaching the hinge to the storage bin/cushion and remove the lid.

INSTALLATION

(1) Position the center seat back lid onto the storage bin/cushion and install the screws.

CENTER SEAT CUSHION**REMOVAL**

(1) Remove the center seat. (Refer to 23 - BODY/SEATS/CENTER SEAT - REMOVAL)

(2) Remove the center armrest/seat back. (Refer to 23 - BODY/SEATS/CENTER ARMREST / SEAT BACK - REMOVAL)

INSTALLATION

(1) Install the center armrest/seat back. (Refer to 23 - BODY/SEATS/CENTER ARMREST / SEAT BACK - INSTALLATION)

(2) Install the center seat. (Refer to 23 - BODY/SEATS/CENTER SEAT - INSTALLATION)

CENTER SEAT CUSHION COVER**REMOVAL**

(1) Remove the center seat cushion or underseat storage bin lid. (Refer to 23 - BODY/SEATS/CENTER SEAT CUSHION/UNDERSEAT STORAGE BIN LID - REMOVAL)

(2) Disconnect the zip strips and remove the cover from the cushion.

INSTALLATION

(1) Install the cover over the center seat cushion and connect the zip strips.

(2) Install the center seat cushion or under seat storage bin lid. (Refer to 23 - BODY/SEATS/CENTER SEAT CUSHION/UNDER SEAT STORAGE BIN LID - INSTALLATION)

UNDER SEAT STORAGE BIN LID

REMOVAL

NOTE: Do not reuse the seat fasteners, always replace with new ones.

- (1) Open the center seat cushion/storage bin.
- (2) Position the seat cushion cover aside, remove the hinge bolts and discard. (Fig. 11)
- (3) Remove the seat cushion.

Fig. 11 CENTER SEAT CUSHION HINGE

- 1 - CENTER SEAT CUSHION
- 2 - HINGE BOLTS
- 3 - SEAT CUSHION HINGE
- 4 - STORAGE BIN/CUSHION

INSTALLATION

NOTE: Do not reuse the seat fasteners, always replace with new ones.

- (1) Position the center seat cushion the hinges and install new bolts.
- (2) Tighten the bolts to 20 N·m (15 ft. lbs.).
- (3) Position the cushion cover back over the hinges.

UNDER SEAT STORAGE BIN

REMOVAL

- (1) Remove the center seat cushion. (Refer to 23 - BODY/SEATS/CENTER SEAT CUSHION - REMOVAL)
- (2) Remove the six screws and remove the bin.

INSTALLATION

- (1) Install the bin over the seat cushion hinges and install the six screws.
- (2) Install the center seat cushion. (Refer to 23 - BODY/SEATS/CENTER SEAT CUSHION - INSTALLATION)

UNDER SEAT STORAGE BIN COVERING

REMOVAL

- (1) Remove the under seat storage bin. (Refer to 23 - BODY/SEATS/UNDER SEAT STORAGE BIN - REMOVAL)
- (2) Disconnect the j-straps and remove the cover.

INSTALLATION

- (1) Install the storage bin cover and connect the j-straps.
- (2) Install the under seat storage bin. (Refer to 23 - BODY/SEATS/UNDER SEAT STORAGE BIN - INSTALLATION)

UNDER SEAT STORAGE BIN LATCH

REMOVAL

- (1) Open the under seat storage bin.
- (2) Remove the two screws and remove the latch assembly.

INSTALLATION

- (1) Install the latch assembly and install the screws.

HEADREST

REMOVAL

- (1) Raise the headrest.
- (2) Press the headrest release button and remove the headrest.

INSTALLATION

- (1) Position the headrest.
- (2) Press the release button and install the headrest.

HEADREST SLEEVE

REMOVAL

- (1) Remove the headrest. (Refer to 23 - BODY/ SEATS/HEADREST - REMOVAL)
- (2) Grasp the sleeves and pull up and out of the seat back to remove.

INSTALLATION

- (1) Position each headrest sleeve into correct seat back hole and press into place fully.
- (2) Install the headrest. (Refer to 23 - BODY/ SEATS/HEADREST - INSTALLATION)

SEAT - FRONT

REMOVAL

NOTE: Do not reuse the seat fasteners, always replace with new ones.

- (1) Remove and discard the front bolts. (Fig. 12)
- (2) Position the seats forward, remove the rear bolts and discard.
- (3) Disconnect the 12v power supply electrical connector, if equipped. (Fig. 13)
- (4) Fold the seat backs forward and roll the seat assembly back in the vehicle.
- (5) Separate the seat assembly by removing and discarding the three nuts on either the drivers or passengers seat. (Fig. 14)
- (6) Remove each section of the seat assembly from the vehicle.

Fig. 12 FRONT SEAT ASSEMBLY

- 1 - FRONT SEAT ASSEMBLY

Fig. 14 REAR ATTACHMENTS

- 1 - 12V POWER SUPPLY HARNESS
- 2 - CENTER SEAT STORAGE BIN
- 3 - FRONT SEAT TRACKS
- 4 - REAR NUTS (4)

INSTALLATION

NOTE: Do not reuse the seat fasteners, always replace with new ones.

- (1) Position each seat section into the vehicle and tip back.

SEAT - FRONT (Continued)

(2) Install the three nuts attaching the center seat section to the other seat, and tighten to 25 N·m (18 ft. lbs.).

(3) Roll the seat assembly forward and install new rear bolts.

(4) Connect the 12v power supply electrical connector.

(5) Tighten the rear bolts to 40 N·m (30 ft. lbs.).

(6) Fold the seat backs up and slide the seats to the rear.

(7) Install new front bolts and tighten to 28 N·m (21 ft. lbs.).

LUMBAR SUPPORT HANDLE/
BEZEL

REMOVAL

CAUTION: Care must be taken not to damage the handle or bezel surface when removing.

(1) Using a trim stick C-4755 or equivalent, pry the manual lumbar knob out of the bezel surround. (Fig. 15)

Fig. 15 MANUAL LUMBAR KNOB

(2) Remove the bezel retaining screws and remove the bezel. (Fig. 16)

INSTALLATION

(1) Align the bezel to the seat back and install the screws.

(2) Snap the manual lumbar knob onto the shaft of the drive mechanism into the bezel surround.

812205b2

Fig. 16 MANUAL LUMBAR BEZEL

- 1 - LUMBAR SHAFT
- 2 - SCREWS
- 3 - BEZEL

SEAT BACK CUSHION / COVER
- FRONT

REMOVAL

(1) Remove the front seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)

(2) Remove the lumbar handle and bezel, if equipped. (Refer to 23 - BODY/SEATS/LUMBAR SUPPORT HANDLE/BEZEL - REMOVAL)

(3) Remove the headrest sleeves. (Refer to 23 - BODY/SEATS/HEADREST SLEEVE - REMOVAL)

(4) Unzip the zip strip at the lower end of the seat back and remove the seat back cover and cushion.

INSTALLATION

(1) Install the seat back cushion and cover onto the seat frame assembly.

(2) Connect the zip strip at the bottom of the seat back.

(3) Install the headrest sleeves. (Refer to 23 - BODY/SEATS/HEADREST SLEEVE - INSTALLATION)

(4) Install the lumbar bezel and handle, if equipped. (Refer to 23 - BODY/SEATS/LUMBAR SUPPORT HANDLE/BEZEL - INSTALLATION)

(5) Install the seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION)

SEAT CUSHION / COVER - FRONT

REMOVAL

- (1) Remove the front seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)
- (2) Remove the screw and remove the recliner handle.
- (3) Remove the two screws and remove the power seat controls, if equipped, and disconnect the electrical connector.
- (4) Remove the seat track. (Refer to 23 - BODY/SEATS/SEAT TRACK - REMOVAL)
- (5) Disconnect the j-straps and remove the seat cushion and cover.

INSTALLATION

- (1) Position the seat cushion and cover onto the frame assembly and connect the j-straps.
- (2) Install the seat track. (Refer to 23 - BODY/SEATS/SEAT TRACK - INSTALLATION)
- (3) Connect the power seat control switch electrical connector, if equipped.
- (4) Install the power seat control switch and install the two screws, if equipped.
- (5) Install the recliner handle and install the screw.
- (6) Install the front seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION)

SEAT TRACK

REMOVAL

- (1) Remove the front seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)
- (2) Disconnect the heated seat electrical connectors, if equipped.
- (3) Remove the four nuts attaching the seat track to the seat and remove the track.

INSTALLATION

- (1) Position the seat track onto the seat and install the four nuts.
- (2) Tighten the four nuts to 25 N·m (18 ft. lbs.).
- (3) Connect the heated seat electrical connectors, if equipped.
- (4) Install the seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION)

SEAT - REAR

REMOVAL

- (1) Remove the load floor. (Refer to 23 - BODY/INTERIOR/LOAD FLOOR - REMOVAL)
- (2) Fold the rear seat cushions up and remove the rear bolts. (Fig. 17)
- (3) Lift each seat assembly up and disengage the seat back frame hooks from the footmans loops bolted to the rear cab back. (Fig. 18)
- (4) Remove the seats from the vehicle.

Fig. 17 SEAT ATTACHMENT

- 1 - OUTER BOLTS (2)
- 2 - REAR SEAT ASSEMBLY
- 3 - INNER BOLTS (4)
- 4 - REAR SEAT BACK
- 5 - OUTER BOLTS (2)

INSTALLATION

- (1) Install the seats into the vehicle and engage the seat back frame hooks with the footmans loops in the cab back panel.
- (2) Install the rear seat bolts and tighten to 40 N·m (30 ft. lbs.).
- (3) Install the load floor. (Refer to 23 - BODY/INTERIOR/LOAD FLOOR - INSTALLATION)

SEAT BACK - REAR

REMOVAL

- (1) Remove the rear seat. (Refer to 23 - BODY/SEATS/SEAT - REAR - REMOVAL)
- (2) Remove the seat back bolts and remove the seat back. (Fig. 19)

INSTALLATION

- (1) Install the seat back and install the bolts.
- (2) Tighten the bolts to 25 N·m (18 ft. lbs.).

SEAT BACK - REAR (Continued)

- 3 - SEAT BACK/CUSHION HINGE
- 4 - SEAT BACK

(3) Install the rear seat. (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION)

SEAT BACK CUSHION / COVER - REAR

REMOVAL

- (1) Remove the rear seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - REAR - REMOVAL)
- (2) Remove the headrest sleeves. (Refer to 23 - BODY/SEATS/HEADREST SLEEVE - REMOVAL)
- (3) Unzip the zip strip at the bottom of the seat back and remove the cover.

INSTALLATION

- (1) Install the seat back cover and connect the zip strip.
- (2) Install the headrest sleeves. (Refer to 23 - BODY/SEATS/HEADREST SLEEVE - INSTALLATION)
- (3) Install the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - REAR - INSTALLATION)

SEAT CUSHION / COVER - REAR

REMOVAL

- (1) Remove the rear seat. (Refer to 23 - BODY/SEATS/SEAT - REAR - REMOVAL)
- (2) Separate the zip strip at the rear of the seat cushion and remove the cushion and cover.

INSTALLATION

- (1) Install the seat cushion and cover over the cushion frame assembly and connect the zip strip.
- (2) Install the seat. (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION)

SEAT CUSHION FRAME - REAR

REMOVAL

(1) Remove the seat cushion/cover. (Refer to 23 - BODY/SEATS/SEAT CUSHION / COVER - REAR - REMOVAL)

(2) Remove the bolts and remove the seat cushion frame. (Fig. 20)

Fig. 20 SEAT CUSHION FRAME ATTACHMENT

- 1 - REAR SEAT BACK
- 2 - REAR SEAT CUSHION FRAME
- 3 - SEAT CUSHION FRAME BOLTS (4)
- 4 - SEAT CUSHION HINGE

INSTALLATION

(1) Install the seat cushion frame onto the rear seat hinges.

(2) Install the bolts and tighten to 32 N·m (24 ft. lbs.).

(3) Install the seat cushion/cover. (Refer to 23 - BODY/SEATS/SEAT CUSHION / COVER - REAR - INSTALLATION)

SEAT BACK REAR - FOOTMANS LOOP BRACKETS

REMOVAL

(1) Remove the rear seat. (Refer to 23 - BODY/SEATS/SEAT - REAR - REMOVAL)

(2) Remove bolts and remove the loop. (Fig. 21)

Fig. 21 FOOTMANS LOOP BRACKET

- 1 - FOOTMANS LOOP (4)
- 2 - BOLTS (2 PER LOOP)
- 3 - CAB BACK PANEL

INSTALLATION

(1) Install the loop and install the bolts.

(2) Tighten the bolts to 12 N·m (9 ft. lbs.).

(3) Install the seat. (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION)

STATIONARY GLASS

REMOVAL	86	WARNING	
INSTALLATION	86	WINDSHIELD SAFETY PRECAUTIONS	88
BACKLITE VENT GLASS		REMOVAL	88
REMOVAL	87	INSTALLATION	88
INSTALLATION	87		

BACKLITE

REMOVAL

It is difficult to salvage the backlite during the removal operation. The backlite is part of the structural support for the roof. The urethane bonding used to secure the glass to the fence is difficult to cut or clean from any surface. Since the molding is set in urethane, it is unlikely it would be salvaged. Before removing the backlite, check the availability from the parts supplier.

The backlite is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the backlite.

- (1) Roll down door glass.
- (2) Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
- (3) On standard cab models remove the upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL)
- (4) On quad cab models remove the upper c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR UPPER TRIM - REMOVAL)
- (5) Bend backlite retaining tabs (Fig. 1) inward against glass.
- (6) Disconnect the rear window defogger electrical connector, if equipped.
- (7) Using a suitable pneumatic knife from inside the vehicle, cut urethane holding backlite frame to opening fence.
- (8) Separate glass from vehicle.

INSTALLATION

- (1) Clean urethane adhesive from around backlite opening fence.
- (2) If necessary, apply black-out primer to outer edge of replacement backlite frame.

80b5cbd5

Fig. 1 Backlite Tabs

- 1 - BACKLITE
- 2 - TAB

- (3) If black-out primer was pre-applied on backlite, clean bonding surface with Isopropyl alcohol and clean lint free cloth. Allow 3 minutes for drying time.
- (4) Apply black-out primer to backlite opening fence.
- (5) Apply a 13 mm (0.5 in.) bead of urethane around the perimeter of the window frame bonding surface (Fig. 2).
- (6) Set glass on lower fence and move glass forward into opening (Fig. 3).
- (7) Firmly push glass against rear window glass opening fence.
- (8) Bend tabs around edges of backlite opening fence to retain glass.
- (9) Clean excess urethane from exterior with MOPAR®, Super Clean or equivalent.
- (10) Allow urethane to cure at least 24 hours (full cure is 72 hours).
- (11) Water test to verify repair before returning vehicle to service.
- (12) Connect the rear window defogger electrical connector, if equipped.

BACKLITE (Continued)

(13) On standard cab models, install the upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION)

(14) On quad cab models, install the upper c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR UPPER TRIM - INSTALLATION)

(15) Install the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

Fig. 2 Urethane Adhesive Application

- 1 - WINDOW FRAME
- 2 - GLASS
- 3 - RETAINER TAB
- 4 - URETHANE ADHESIVE

Fig. 3 Backlite Installation

- 1 - BACKLITE

BACKLITE VENT GLASS

REMOVAL

- (1) Slide the upper run channel out of the window frame. (Fig. 4)
- (2) Slide the vent glass upward to remove from the lower window frame.
- (3) Lower the glass out of the upper window frame and remove.

Fig. 4 UPPER GLASS RUN CHANNEL

- 1 - GLASS RUN CHANNEL
- 2 - VENT GLASS FRAME
- 3 - VENT GLASS

INSTALLATION

- (1) Slide the vent glass upper edge into window frame and insert the lower edge into the lower molding.
- (2) Position the upper run channel into the window frame and slide it into place.
- (3) Verify vent glass operation.

WINDSHIELD

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT.

- URETHANE ADHESIVES ARE APPLIED AS A SYSTEM. USE GLASS CLEANER, GLASS PREP SOLVENT, GLASS PRIMER, PVC (VINYL) PRIMER AND PINCH WELD (FENCE) PRIMER PROVIDED BY THE ADHESIVE MANUFACTURER. IF NOT, STRUCTURAL INTEGRITY COULD BE COMPROMISED.

- DAIMLERCHRYSLER DOES NOT RECOMMEND GLASS ADHESIVE BY BRAND. TECHNICIANS SHOULD REVIEW PRODUCT LABELS AND TECHNICAL DATA SHEETS, AND USE ONLY ADHESIVES THAT THEIR MANUFACTURERS WARRANT WILL RESTORE A VEHICLE TO THE REQUIREMENTS OF FMVSS 212. TECHNICIANS SHOULD ALSO INSURE THAT PRIMERS AND CLEANERS ARE COMPATIBLE WITH THE PARTICULAR ADHESIVE USED.

- BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

- VAPORS THAT ARE EMITTED FROM THE URETHANE ADHESIVE OR PRIMER COULD CAUSE PERSONAL INJURY. USE THEM IN A WELL-VENTILATED AREA.

- SKIN CONTACT WITH URETHANE ADHESIVE SHOULD BE AVOIDED. PERSONAL INJURY MAY RESULT.

- ALWAYS WEAR EYE AND HAND PROTECTION WHEN WORKING WITH GLASS.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

REMOVAL

(1) Remove inside rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL).

(2) Remove cowl grill. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

(3) Remove the a-pillar weatherstrip retainer. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/A-PILLAR WEATHERSTRIP RETAINER - REMOVAL)

(4) Remove the a-pillar trim panels. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)

(5) Remove the headliner and from the inside of the vehicle, cut the upper urethane bonding from around windshield upper edge using a suitable sharp cold knife (C-4849). A pneumatic cutting device can be used but is not recommended. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)

(6) From the outside of the vehicle, cut urethane bonding from the remaining sides of the windshield using a suitable sharp cold knife (C-4849). A pneumatic cutting device can be used but is not recommended.

(7) Separate windshield from vehicle.

INSTALLATION

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing windshield to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

The windshield fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

(1) Place replacement windshield into windshield opening and position glass in the center of the opening against the support spacers. Mark the outside surface of the glass at the support spacers with a grease pencil or pieces of masking tape and ink pen to use as a reference for installation. Remove replacement windshield from windshield opening (Fig. 5).

(2) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 6).

(3) Clean inside of windshield with MOPAR Glass Cleaner and lint-free cloth.

(4) Apply clear glass primer 25 mm (1 in.) wide around perimeter of windshield and wipe with a new clean and dry lint-free cloth.

(5) Apply black-out primer onto the glass using the windshield molding as a guide. The primer should be 15 mm (5/8 in.) wide on the top and sides of the glass

WINDSHIELD (Continued)

and 25 mm (1 in.) on the bottom of windshield. Allow at least three minutes drying time.

(6) Locate **new** support spacers on support brackets and adjust to lowest height. (Fig. 5)

(7) Position seven new foam spacers on the inside surface of the windshield, flush with the lower and side edges. (Fig. 7)

(8) Position three new foam spacers on the inside surface of the windshield, at a minimum distance of 3 mm (0.12 in.) from the top edge of the windshield. (Fig. 7)

(9) Apply a 13 mm (1/2 in.) high and 10 mm (3/8 in.) wide bead of urethane around the perimeter of windshield. At the top, apply the bead 7 mm (1/4 in.) inboard from the glass edge. On the other three sides apply the bead 14 mm (0.55 in.) inboard from the glass edge. The urethane bead should be shaped in a triangular cross-section, this can be achieved by notching the tip of the applicator (Fig. 8).

(10) Install the a-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

(11) With the aid of a helper, position the windshield over the windshield opening. Align the reference marks at the bottom of the windshield to the support spacers.

(12) Slowly lower windshield glass to the fence opening guiding the lower corners into proper position. Beginning at the bottom and continuing to the top, push glass onto fence along the A-Pillars. Push windshield inward to the fence at the bottom corners (Fig. 9).

(13) Push windshield upward, setting the windshield to roof gap to 1.5 mm (0.06 in.) to 3 mm (0.12 in.) and ratchet up the adjustable support brackets.

(14) Using clean water, lightly mist the support spacers.

(15) Clean excess urethane from exterior with MOPAR® Super Clean or equivalent.

(16) Install cowl grill. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

(17) Install rear view mirror support bracket. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).

(18) Install rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).

(19) Install the a-pillar weatherstrip retainer. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/A-PILLAR WEATHERSTRIP RETAINER - INSTALLATION)

(20) After urethane has cured, remove tape strips and water test windshield to verify repair.

A-PILLAR WEATHERSTRIP RETAINER

REMOVAL

(1) Remove the drip rail weatherstrip retainer. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DRIP RAIL WEATHERSTRIP - REMOVAL)

(2) Remove the five screws and remove the weatherstrip retainer. (Fig. 1)

INSTALLATION

(1) Install the weatherstrip retainer and install the screws.

(2) Install the drip rail weatherstrip retainer. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DRIP RAIL WEATHERSTRIP - INSTALLATION)

DRIP RAIL WEATHERSTRIP

REMOVAL

(1) Open the doors and separate the weatherstrip from the drip rail and a-pillar retainers. (Fig. 1)

INSTALLATION

(1) Position the weatherstrip onto the drip rail and a-pillar retainers and seat fully.

80d4700e

Fig. 1 DOOR OPENING WEATHERSTRIPS/SEALS

- 9 - CORNER SEAL

DOOR OPENING SEAL

REMOVAL

FRONT DOOR SEAL

(1) Remove the cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL)

(2) Remove the lower b-pillar trim panel. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)

(3) Separate the door opening seal from the door opening flange. (Fig. 1)

REAR DOOR SEAL

(1) Remove the lower b-pillar trim panel. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)

(2) Remove the lower c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)

(3) Separate the door opening seal from the door opening flange. (Fig. 1)

INSTALLATION

FRONT DOOR SEAL

(1) Position the seal to the bottom of the door opening, with bulb facing outboard, starting the installation at the center of the lower flange. Press the seal onto the sill flange and work around the perimeter of the door opening until fully seated. Work in one direction, smoothing the seal to avoid puckers or wrinkles.

(2) Install the lower b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)

(3) Install the cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)

(4) When installing a new weatherstrip on the front door opening, remove the tear strip starting at the splice and moving around the front of the door to the back of the opening.

REAR DOOR SEAL

(1) Position the seal to the bottom of the door opening, with bulb facing outboard, starting the installation at the center of the lower flange. Press the seal onto the sill flange and work around the perimeter of the door opening until fully seated. Work in one direction, smoothing the seal to avoid puckers or wrinkles.

(2) Install the lower c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)

(3) Install the lower b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)

(4) When installing a new weatherstrip on the rear door opening, remove the tear strip starting at the splice and moving around the back of the door to the front of the opening.

DRIP RAIL WEATHERSTRIP RETAINER

REMOVAL

(1) Separate the drip rail weatherstrip from the weatherstrip retainer. (Fig. 1)

(2) Remove the seven screws and remove the retainer.

INSTALLATION

(1) Install the weatherstrip retainer and install the seven screws.

(2) Position the weatherstrip over the retainer flange and seat fully.

FRONT DOOR GLASS RUN WEATHERSTRIP

REMOVAL

(1) Remove the door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL)

(2) Separate the weatherstrip out of the door frame and remove through the window opening. (Fig. 2)

INSTALLATION

NOTE: A mixture of soap and water may be used to aid installation of the weatherstrip into the corners.

(1) Position the glass run weatherstrip into the door through the window opening.

(2) Position the weatherstrip into the upper corners and seat firmly.

(3) From back to front, seat the weatherstrip between the corners and then down the sides firmly.

(4) Install the door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION)

FRONT DOOR OUTER BELT MOLDING

REMOVAL

(1) Remove the screw and separate the belt molding from the door flange from the back to the front. (Fig. 2)

FRONT DOOR OUTER BELT MOLDING (Continued)

Fig. 2 FRONT DOOR GLASS SEALS

- 1 - OUTER BELT MOLDING
- 2 - FRONT DOOR GLASS RUN WEATHERSTRIP
- 3 - LOWER DOOR SEAL
- 4 - SCREW
- 5 - FRONT DOOR

INSTALLATION

- (1) Position the belt molding onto the door flange and seat fully.
- (2) Install the screw.

FRONT DOOR INNER BELT MOLDING

REMOVAL

- (1) Remove the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Separate the belt molding from the mounting flange from the back to the front. (Fig. 3)

INSTALLATION

- (1) Position the belt molding and seat onto the mounting flange fully.
- (2) Install the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

Fig. 3 INNER BELT MOLDING

- 1 - BELT MOLDING
- 2 - CORNER SEAL
- 3 - FRONT DOOR

REAR DOOR GLASS RUN WEATHERSTRIP

REMOVAL

- (1) Lower the glass.
- (2) Separate the weatherstrip out of the door frame and remove through the window opening. (Fig. 4)

INSTALLATION

NOTE: A mixture of soap and water may be used to aid installation of the weatherstrip into the corners.

- (1) Position the glass run weatherstrip into the door through the window opening.
- (2) Position the weatherstrip into the upper corners and seat firmly.
- (3) From back to front, seat the weatherstrip between the corners and then down the sides firmly.

REAR DOOR OUTER BELT MOLDING

REMOVAL

- (1) Remove the screw and separate the belt molding from the door flange from the back to the front. (Fig. 4)

REAR DOOR OUTER BELT MOLDING (Continued)

Fig. 4 REAR DOOR GLASS SEALS

- 1 - OUTER BELT MOLDING
- 2 - REAR DOOR
- 3 - SCREW
- 4 - LOWER DOOR SEAL
- 5 - GLASS RUN WEATHERSTRIP

INSTALLATION

- (1) Position the belt molding onto the door flange and seat fully.
- (2) Install the screw.

REAR DOOR INNER BELT MOLDING

REMOVAL

- (1) Remove the door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (2) Separate the belt molding from the mounting flange from the back to the front. (Fig. 5)

Fig. 5 REAR DOOR INNER SEALS

- 1 - REAR SECONDARY SEAL
- 2 - INNER BELT MOLDING
- 3 - FRONT SECONDARY SEAL
- 4 - SCREWS

INSTALLATION

- (1) Position the belt molding and seat onto the mounting flange fully.
- (2) Install the door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

HEATING & AIR CONDITIONING

DESCRIPTION

DESCRIPTION - ENGINE COOLING SYSTEM REQUIREMENTS

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to Cooling for more information before opening or attempting any service to the engine cooling system.

DESCRIPTION - HEATER AND AIR CONDITIONER

A manually controlled single zone type heating-air conditioning system or a manually controlled dual zone type heating-air conditioning system is available on this model.

All vehicles are equipped with a common heater, ventilation and air conditioning (HVAC) housing (Fig. 1). The system combines air conditioning, heating, and ventilating capabilities in a single unit housing mounted within the passenger compartment under the instrument panel. The HVAC housing includes:

- Blower motor
- Blower motor resistor block

- Heater core
- Evaporator coil
- Blend door and actuator
- Defrost door and actuator
- Mode door and actuator
- Recirculation door and actuator

Based upon the system and mode selected, conditioned air can exit the HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost outlet is located on the top of the housing, the panel outlet is located on the face of the housing and the floor outlet is located on the bottom of the housing. Once the conditioned air exits the unit housing, it is further directed through molded plastic ducts to the various outlets in the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlet** - A single large defroster outlet is located in the center of the instrument panel top cover, near the base of the windshield.
- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at each outboard end of the instrument panel top cover, near the belt line at the A-pillars.
- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and two located near the top of the instrument panel center bezel.
- **Front Floor Outlets** - There are two front floor outlets, one located above each side of the floor panel center tunnel near the dash panel.

OPERATION - HEATER AND AIR CONDITIONER

The heating and air conditioning systems pulls outside (ambient) air through the cowl opening at the base of the windshield, then into the plenum cham-

- 11 - MODE DOOR ACTUATOR

ber above the heating, ventilation and air conditioning (HVAC) housing. On models equipped with air conditioning, the air passes through the evaporator coil. Air flow can be directed either through or around the heater core. This is done by adjusting the blend door with the temperature control knob on the A/C-heater control located the instrument panel. The air flow can then be directed from the panel, floor and defrost outlets in various combinations using the mode control knob located on the A/C-heater control. Air flow velocity can be adjusted with the blower speed selector located on the A/C-heater control.

NOTE: It is important to keep the air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accu-

mulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.

The heater and air conditioning systems are blend-air type systems. In a blend-air system, a blend door controls the amount of unconditioned air (or cooled air from the evaporator on models with air conditioning) that is allowed to flow through, or around, the heater core. A temperature control knob determines the discharge air temperature by actuating an electric motor, which operates the blend door. This allows an almost immediate control of the output air temperature of the system.

On all models, the outside air intake can be shut off by selecting the Recirculation Mode with the mode control knob. This will operate an electric actuated recirculation air door that closes off the outside fresh air intake and recirculates the air that is already inside the vehicle.

The air conditioning compressor can be engaged in any mode by pressing the snowflake, A/C on/off button. It can also be engaged by placing the mode control in the mix to defrost positions. This will remove heat and humidity from the air before it is directed through or around the heater core. The mode control knob on the A/C-heater control is used to also direct the conditioned air to the selected system outlets. The mode control switch uses an electric motor to control the mode doors.

The defroster outlet receives airflow from the HVAC housing through the molded plastic defroster duct, which connects to the HVAC housing defroster outlet. The airflow from the defroster outlets is directed by fixed vanes in the defroster outlet grilles and cannot be adjusted. The defroster outlet grilles are integral to the instrument panel top cover.

The side window demister outlets receive airflow from the HVAC housing through the molded plastic defroster duct and two molded plastic demister ducts. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister outlet grilles are integral to the instrument panel. The demisters direct air from the HVAC housing through the outlets located on the top corners of the instrument panel. The demisters operate when the mode control knob is positioned in the floor-defrost and defrost-only settings. Some air may be noticeable from the demister outlets when the mode control is in the bi-level to floor positions.

HEATING & AIR CONDITIONING (Continued)

The panel outlets receive airflow from the HVAC housing through a molded plastic main panel duct, center panel duct and two end panel ducts. The two end panel ducts direct airflow to the left and right instrument panel outlets, while the center panel duct directs airflow to the two center panel outlets. Each of these outlets can be individually adjusted to direct the flow of air.

The floor outlets receive airflow from the HVAC housing through the floor distribution duct. The front floor outlets are integral to the molded plastic floor distribution duct, which is secured to the bottom of the housing. The floor outlets cannot be adjusted.

The air conditioner for all models is designed for the use of non-CFC, R-134a refrigerant. The air conditioning system has an evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. This air conditioning system uses a fixed orifice tube in the liquid line near the condenser outlet tube to meter refrigerant flow to the evaporator coil. To maintain minimum evaporator temperature and prevent evaporator freezing, a evaporator temperature sensor is used. The JTEC control module is programmed to respond to the evaporator temperature sensor input by cycling the air conditioning compressor clutch as necessary to optimize air conditioning system performance and to protect the system from evaporator freezing.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - A/C PERFORMANCE

The air conditioning system is designed to remove heat and humidity from the air entering the passenger compartment. The evaporator, located in the HVAC housing, is cooled to temperatures near the freezing point. As warm damp air passes over the fins in the evaporator, moisture in the air condenses to water, dehumidifying the air. Condensation on the evaporator fins reduces the evaporators ability to absorb heat. During periods of high heat and humidity, an air conditioning system will be less effective. With the instrument control set to Recirculation mode, only air from the passenger compartment passes through the evaporator. As the passenger compartment air dehumidifies, A/C performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the air conditioning system. When humidity is high, the evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of

the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and tubing. This reduces the amount of heat the evaporator can absorb from the air. High humidity greatly reduces the ability of the evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their air conditioning system on humid days. A performance test is the best way to determine whether the system is performing up to standard. This test also provides valuable clues as to the possible cause of trouble with the air conditioning system.

PERFORMANCE TEST PROCEDURE

Review Safety Warnings and Cautions before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Air temperature in test room and on vehicle must be 21° C (70° F) minimum for this test.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

- (1) Connect a tachometer and a manifold gauge set or A/C recycling/charging station.
- (2) Set the A/C-heater mode control in the Recirculation Mode position, the temperature control knob in the full cool position, and the blower motor switch to the highest speed position.
- (3) Start the engine and hold at 1,000 rpm with the A/C compressor clutch engaged.
- (4) The engine should be warmed up to operating temperature with the doors closed and windows open.
- (5) Insert a thermometer in the driver side center panel A/C-heater outlet and operate the engine for five minutes.
- (6) The compressor clutch may cycle, depending upon the ambient temperature and humidity.
- (7) With the compressor clutch engaged, record the discharge air temperature and the compressor discharge pressure.
- (8) If the discharge air temperature fails to meet the specifications in the A/C Performance Temperature chart, refer to the Pressure Diagnosis chart.

HEATING & AIR CONDITIONING (Continued)

PERFORMANCE TEMPERATURE AND PRESSURE

Ambient Air Temperature	21° C (70° F)	27° C (80° F)	32° C (90° F)	38° C (100° F)	43° C (110° F)
Air Temperature at Center Panel Outlet	7° C (45° F)	7° C (45° F)	13° C (55° F)	13° C (55° F)	18° C (64° F)
Compressor Inlet Pressure at Service Port (low Side)	138 to 207 kPa (20 to 30 psi)	172 to 241 kPa (25 to 35 psi)	207 to 276 kPa (30 to 40 psi)	241 to 310 kPa (35 to 45 psi)	276 to 345 kPa (40 to 50 psi)
Compressor Discharge Pressure at Service Port (High Side)	1034 to 1724 kPa (150 to 250 psi)	1379 to 2068 kPa (200 to 300 psi)	1724 to 2413 kPa (250 to 350 psi)	1999 to 2689 kPa (290 to 390 psi)	2413 to 2965 kPa (350 to 430 psi)

(9) Compare the compressor discharge pressure to the Performance Temperature and Pressure chart. If the compressor discharge pressure is high, see the Pressure Diagnosis chart.

PRESSURE DIAGNOSIS

Condition	Possible Causes	Correction
Constant compressor engagement and warm air from passenger vents.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system. 2. Faulty fuse. 3. Faulty A/C compressor clutch coil. 4. Faulty A/C compressor clutch relay. 5. Improperly installed or faulty Evaporator Temperature Sensor. 6. Faulty A/C pressure transducer. 7. Faulty Powertrain Control Module (PCM).	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 2. Check the fuses in the Power Distribution Center and the junction block. Repair the shorted circuit or component and replace the fuses, if required. 3. See A/C Compressor Clutch Coil in this group. Test the compressor clutch coil and replace, if required. 4. See A/C Compressor Clutch Relay in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required. 5. See Evaporator Temperature Sensor in this group. Reinstall or replace the sensor as required. 6. See A/C pressure transducer in this group. Test the switch and replace, if required. 7. (Refer to Appropriate Diagnostic Information). Test the PCM and replace, if required.

HEATING & AIR CONDITIONING (Continued)

Condition	Possible Causes	Correction
The low side pressure is too low, and the high side pressure is too high.	<ol style="list-style-type: none"> 1. Restricted refrigerant flow through the refrigerant lines. 2. Restricted refrigerant flow through the fixed orifice tube. 3. Restricted refrigerant flow through the condenser. 	<ol style="list-style-type: none"> 1. See Liquid, Suction, and Discharge Line in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required. 2. See A/C Orifice Tube in this group. Replace the liquid line, if required. 3. See A/C Condenser in this group. Replace the restricted condenser, if required.

DIAGNOSIS AND TESTING - HEATER PERFORMANCE TEST

Review Safety Warnings and Cautions before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

Check the coolant level, drive belt tension, vacuum line connections, radiator air flow and fan operation. Start engine and allow to warm up to normal temperature.

WARNING: DO NOT REMOVE RADIATOR CAP WHEN ENGINE IS HOT, PERSONAL INJURY CAN RESULT.

If vehicle has been run recently, wait 15 minutes before removing cap. Place a rag over the cap and

turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT: TEST AND ACTION

Engine coolant is provided to the heater system by two heater hoses. With the engine idling at normal operating temperature, set the temperature control to maximum heat, the mode control to the floor position, and the blower in the highest speed position. Using a test thermometer, check the temperature of the air being discharged from the floor outlets. Compare the test thermometer reading to the Temperature Reference chart.

TEMPERATURE REFERENCE CHART

Ambient Air Temperature	15.5° C (60° F)	21.1° C (70° F)	26.6° C (80° F)	32.2° C (90° F)
Minimum Air Temperature at Floor Outlet	62.2° C (144° F)	63.8° C (147° F)	65.5° C (150° F)	67.2° C (153° F)

Both of the heater hoses should be HOT to the touch (coolant return hose should be slightly cooler than the supply hose). If the coolant return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the heater system. If both heater hoses are cool to the touch, inspect the engine cooling system (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).

OBSTRUCTED COOLANT FLOW Possible locations or causes of obstructed coolant flow are as follows:

- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- Plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is insufficient, a mechanical problem may exist.

MECHANICAL PROBLEMS Possible causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake.
- Obstructed heater system outlets.
- Blend door not functioning properly.

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control knob on the A/C-heater control, the following could require service:

- Blend door binding.
- Faulty blend door motor.

HEATING & AIR CONDITIONING (Continued)

- Faulty A/C-heater control.
- Faulty related wiring harness or connectors.
- Improper engine coolant temperature.

A/C SYSTEM SPECIFICATION CHART

A/C COMPRESSOR CLUTCH/ COIL

DESCRIPTION

The compressor clutch assembly consists of a stationary electromagnetic coil, a pulley bearing and pulley assembly, and a clutch plate (Fig. 1). The electromagnetic coil and the pulley bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is keyed to the compressor shaft and secured with a nut. These components provide the means to

engage and disengage the compressor from the engine serpentine accessory drive belt.

OPERATION

The A/C compressor clutch provides the means to engage and disengage the A/C compressor from the engine serpentine accessory drive belt. When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the pulley bearing, which is part of the pulley assembly. The compressor clutch

- 5 - CLUTCH SHIMS
- 6 - SNAP RING
- 7 - SNAP RING

and coil are the only serviced parts on the compressor.

A/C compressor clutch engagement is controlled by several components: the A/C-heater control, A/C pressure transducer, A/C compressor clutch relay, evaporator temperature sensor and the powertrain control module (PCM). The PCM may delay compressor clutch engagement for up to thirty seconds (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION).

DIAGNOSIS AND TESTING - A/C COMPRESSOR CLUTCH COIL

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information). The battery must be fully-charged before performing the following tests. Refer to Battery for more information.

(1) Connect an ammeter (0 to 10 ampere scale) in series with the clutch coil terminal. Use a voltmeter (0 to 20 volt scale) with clip-type leads for measuring the voltage across the battery and the compressor clutch coil.

(2) With the A/C-heater controls in any A/C mode, and the blower motor switch in the lowest speed position, start the engine and run it at normal idle.

(3) The compressor clutch coil voltage should read within 0.2 volts of the battery voltage. If there is voltage at the clutch coil, but the reading is not within 0.2 volts of the battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as required. If there is no voltage reading at the clutch coil, use a DRB III[®] scan tool and (Refer to Appropriate Diagnostic Information) for testing of the

compressor clutch circuit and PCM control. The following components must be checked and repaired as required before you can complete testing of the clutch coil:

- Fuses in the junction block and the power distribution center (PDC)
- A/C-heater control
- A/C compressor clutch relay
- A/C pressure transducer
- Evaporator temperature sensor
- Powertrain control module (PCM)

(4) The compressor clutch coil is acceptable if the current draw measured at the clutch coil is within specifications with the electrical system voltage at 11.5 to 12.5 volts (Refer to 24 - HEATING & AIR CONDITIONING - SPECIFICATIONS). This should only be checked with the work area temperature at 21° C (70° F). If system voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until the system voltage drops below 12.5 volts.

(a) If the clutch coil current reading is above specifications, the coil is shorted and should be replaced.

(b) If the clutch coil current reading is zero, the coil is open and should be replaced.

STANDARD PROCEDURE - A/C COMPRESSOR CLUTCH BREAK-IN

After a new compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the A/C-heater control to the Recirculation Mode, the blower motor switch in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL

The refrigerant system can remain fully-charged during compressor clutch, rotor, or coil replacement. The compressor clutch can be serviced in the vehicle.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Disconnect the compressor clutch coil wire harness connector.

(4) Remove the bolts that secure the compressor to the mounting bracket.

(5) Remove the compressor from the mounting bracket. Support the compressor in the engine compartment while servicing the clutch.

A/C COMPRESSOR CLUTCH/COIL (Continued)

(6) Insert the two pins of the spanner wrench (Special Tool C-4489 or equivalent) into the holes of the clutch plate. Hold the clutch plate stationary and remove the hex nut (Fig. 2).

Fig. 2 Clutch Nut Remove - Typical

- 1 - CLUTCH PLATE
- 2 - SPANNER

(7) Remove the clutch plate.
 (8) Remove the compressor clutch shims.
 (9) Remove the external front housing snap ring with snap ring pliers (Fig. 3).

Fig. 3 External Snap Ring Remove - Typical

- 1 - PULLEY
- 2 - SNAP RING PLIERS

(10) Install the lip of the rotor puller (Special Tool C-6141-1 or equivalent) into the snap ring groove exposed in the previous step, and install the shaft protector (Special Tool C-6141-2 or equivalent) (Fig. 4).

(11) Install the puller through-bolts (Special Tool C-6461 or equivalent) through the puller flange and into the jaws of the rotor puller and tighten (Fig. 5).

Fig. 4 Shaft Protector and Puller - Typical

- 1 - PULLER JAW
- 2 - SHAFT PROTECTOR

Turn the puller center bolt clockwise until the rotor is free.

CAUTION: DO NOT APPLY FORCE TO THE END OF THE COMPRESSOR SHAFT.

Fig. 5 Install Puller Plate - Typical

- 1 - PULLER JAW
- 2 - PULLER

(12) Remove the screw and retainer from the clutch coil lead wire harness on the compressor front housing (Fig. 6).

(13) Remove the snap ring from the compressor hub and remove the clutch field coil (Fig. 7). Slide the clutch field coil off of the compressor hub.

INSPECTION

Examine the friction surfaces of the clutch pulley and the clutch plate for wear. The pulley and clutch plate should be replaced if there is excessive wear or scoring.

A/C COMPRESSOR CLUTCH/COIL (Continued)

Fig. 6 Clutch Coil Lead Wire Harness - Typical

- 1 - COIL
- 2 - COIL WIRE
- 3 - RETAINER SCREW

Fig. 7 Clutch Field Coil Snap Ring Remove - Typical

- 1 - COIL
- 2 - SNAP RING PLIERS

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor for oil. Remove the felt from the front cover. If the felt is saturated with oil, the shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and clutch plate, if required.

INSTALLATION

- (1) Install the clutch field coil and snap ring.
- (2) Install the screw and retainer on the clutch coil lead wire harness on the compressor front housing. Tighten screw to 2.2 N·m (20 in. lbs.).
- (3) Align the rotor assembly squarely on the front compressor housing hub.
- (4) Install the rotor bearing assembly with the installer (Special Tool C-6871 or equivalent) (Fig. 8). Thread the installer on the shaft, then turn the nut until the rotor assembly is seated.

Fig. 8 Clutch Pulley Install - Typical

- 1 - ROTOR BEARING ASSEMBLY
- 2 - INSTALLER

- (5) Install the external front housing snap ring with snap ring pliers. The bevel side of the snap ring must be facing outward. Press the snap ring to make sure it is properly seated in the groove.

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the front housing of the compressor.

- (6) Install the original clutch shims on the compressor shaft.
- (7) Install the clutch plate. Install the shaft hex nut and tighten to 15–20 N·m (11–15 ft. lbs.).
- (8) Check the clutch air gap with a feeler gauge (Fig. 9). If the air gap does not meet specifications, add or subtract shims as required (Refer to 24 - HEATING & AIR CONDITIONING - SPECIFICATIONS).

A/C COMPRESSOR CLUTCH/COIL (Continued)

J8924-28

Fig. 9 Check Clutch Air Gap - Typical

1 - FEELER GAUGE

NOTE: The air gap is determined by the spacer shims. When installing an original, or a new clutch assembly, try the original shims first. When installing a new clutch onto a compressor that previously did not have a clutch, use a 1.0, 0.50, and 0.13 millimeter (0.040, 0.020, and 0.005 inch) shims from the new clutch hardware package that is provided with the new clutch.

(9) To complete the procedure (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

A/C COMPRESSOR CLUTCH RELAY

DESCRIPTION

The A/C compressor clutch relay (Fig. 10) is a International Standards Organization (ISO) micro-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The ISO micro-relay terminal functions are the same as a conventional ISO relay. However, the ISO micro-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay. The A/C compressor clutch relay is located in the intergrated power module (IPM) in the engine compartment. See the fuse and relay layout label affixed to the inside surface of the IPM cover for A/C compressor clutch relay identification and location.

The black, molded plastic case is the most visible component of the A/C compressor clutch relay. Five

**Fig. 10 A/C Compressor Clutch Micro-Relay**

30 - COMMON FEED
 85 - COIL GROUND
 86 - COIL BATTERY
 87 - NORMALLY OPEN
 87A - NORMALLY CLOSED

male spade-type terminals extend from the bottom of the base to connect the relay to the vehicle electrical system, and the ISO designation for each terminal is molded into the base adjacent to each terminal. The ISO terminal designations are as follows:

- **30 (Common Feed)** - This terminal is connected to the movable contact point of the relay.
- **85 (Coil Ground)** - This terminal is connected to the ground feed side of the relay control coil.
- **86 (Coil Battery)** - This terminal is connected to the battery feed side of the relay control coil.
- **87 (Normally Open)** - This terminal is connected to the normally open fixed contact point of the relay.
- **87A (Normally Closed)** - This terminal is connected to the normally closed fixed contact point of the relay.

OPERATION

The A/C compressor clutch relay is an electromechanical switch that uses a low current input from the powertrain control module (PCM) or engine control module (ECM) depending on engine application, to control the high current output to the compressor clutch electromagnetic coil. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. The resistor or diode is connected in parallel with the relay coil in the relay, and helps to dissipate voltage

A/C COMPRESSOR CLUTCH RELAY (Continued)

spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The A/C compressor clutch relay terminals are connected to the vehicle electrical system through a receptacle in the integrated power module (IPM). The inputs and outputs of the A/C compressor clutch relay include:

- The common feed terminal (30) receives a battery current input from a fuse in the IPM through a fused B(+) circuit at all times.

- The coil ground terminal (86) receives a ground input from the PCM/ECM through the A/C compressor clutch relay control circuit only when the PCM/ECM electronically pulls the control circuit to ground.

- The coil battery terminal (85) receives a battery current input from PTC 1 in the IPM through a fused ignition switch output (run) circuit only when the ignition switch is in the On position.

- The normally open terminal (87) provides a battery current output to the compressor clutch coil through the A/C compressor clutch relay output circuit only when the A/C compressor clutch relay coil is energized.

- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the A/C compressor clutch relay coil is de-energized.

Refer to the appropriate wiring information for diagnosis and testing of the micro-relay and for complete HVAC wiring diagrams.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the cover from the integrated power module (IPM) (Fig. 11).

(3) Refer to the fuse and relay layout label on the IPM cover for compressor clutch relay identification and location.

(4) Remove the A/C compressor clutch relay from the IPM.

INSTALLATION

(1) See the fuse and relay layout label affixed to the underside of the IPM cover for A/C compressor clutch relay location.

(2) Position the A/C compressor clutch relay in the proper receptacle in the IPM.

(3) Align the A/C compressor clutch relay terminals with the terminal cavities in the IPM receptacle.

(4) Push down firmly on the A/C compressor clutch relay until the terminals are fully seated in the terminal cavities in the IPM receptacle.

(5) Install the cover onto the IPM.

A/C HEATER CONTROL**DESCRIPTION**

The heater and air conditioning systems use electrical controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle.

The A/C-heater control for the Single Zone system (Fig. 12) or Dual Zone system (Fig. 13) is located to the right of the instrument cluster on the instrument panel.

The Single Zone control panel contains a rotary-type temperature control switch, a rotary-type mode control switch and a rotary-type blower motor speed switch. The A/C-heater control also has a push button to activate the optional heated side view mirror defroster elements and to turn the A/C on.

The Dual Zone control panel contains a pair of slider-type temperature control switches, a rotary-type mode control switch and a rotary-type blower motor speed switch. The control also has buttons to activate the optional heated sideview mirror defroster elements, turn the A/C on and set the system to Max A/C.

The A/C-heater control panel cannot be repaired. If faulty or damaged, the entire unit must be replaced.

A/C HEATER CONTROL (Continued)

The illumination lamps are available for service replacement.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRE-

CAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the center bezel from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
- (3) Remove the screws that secure the A/C-heater control to the instrument panel (Fig. 14).

Fig. 14 A/C-Heater Control - Typical, Rear View

- 2 - SCREW (4)
- 3 - A/C-HEATER CONTROL ELECTRICAL CONNECTOR
- 4 - HEATED SIDEVIEW MIRROR ELECTRICAL CONNECTOR
- 5 - A/C-HEATER CONTROL

INSTALLATION

- (1) Position the A/C-heater control onto the instrument panel center bezel and install the retaining screws. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (2) Install the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
- (3) Reconnect the battery negative cable.

A/C PRESSURE TRANSDUCER

DESCRIPTION

The A/C pressure transducer is a switch that is installed on a fitting located on the refrigerant discharge line between the compressor and the condenser in the front corner of the engine compartment. An internally threaded hex fitting on the transducer connects it to the externally threaded Schrader-type fitting on the discharge line. A rubber O-ring seals the connection between the transducer and the discharge line fitting. Three terminals within a molded plastic connector receptacle on the top of the transducer connect it to the vehicle electrical system through a wire lead and connector of the headlamp and dash wire harness.

A/C PRESSURE TRANSDUCER (Continued)

The A/C pressure transducer cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the discharge line. The transducer will change its internal resistance in response to the pressures it monitors. The Powertrain Control Module (PCM) or the Engine Control Module (ECM) depending on engine application, provides a five volt reference signal and a sensor ground to the transducer, then monitors the output voltage of the transducer on a sensor return circuit to determine refrigerant pressure. The PCM/ECM is programmed to respond to this and other sensor inputs by controlling the operation of the air conditioning compressor clutch and the radiator cooling fan to help optimize air conditioning system performance and to protect the system components from damage. The A/C pressure transducer input to the PCM/ECM will also prevent the air conditioning compressor clutch from engaging when ambient temperatures are below about 10° C (50° F) due to the pressure/temperature relationship of the refrigerant. The Schrader-type valve in the discharge line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the system. The A/C pressure transducer is diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - A/C PRESSURE TRANSDUCER

The A/C pressure transducer is tested using a DRBIII® scan tool. Refer to the appropriate diagnostic information. Before testing the A/C pressure transducer, be certain that the transducer wire harness connection is clean of corrosion and properly connected. For the air conditioning system to operate, an A/C pressure transducer voltage reading between 0.451 and 4.519 volts is required. Voltages outside this range indicate a low or high refrigerant system pressure condition to the Powertrain Control Module (PCM) or Engine Control Module (ECM) depending on engine application. The PCM/ECM is programmed to respond to a low or high refrigerant system pressure by suppressing operation of the compressor. Refer to the A/C Pressure Transducer Voltage chart for the possible conditions indicated by the transducer voltage reading.

A/C PRESSURE TRANSDUCER VOLTAGE CHART

Voltage	Possible Indication
0.0	1. No sensor supply voltage from PCM/ECM. 2. Shorted sensor circuit. 3. Faulty transducer.
0.150 TO 0.450	1. Ambient temperature below 10° C (50° F). 2. Low refrigerant system pressure.
0.451 TO 4.519	1. Normal refrigerant system pressure.
4.520 TO 4.850	1. High refrigerant system pressure.
5.0	1. Open sensor circuit. 2. Faulty transducer.

REMOVAL

NOTE: Note: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

- (1) Disconnect and isolate the battery negative cable.
- (2) Disconnect the wire harness connector from the A/C pressure transducer.
- (3) Remove the A/C pressure transducer from the fitting on the discharge line (Fig. 15).
- (4) Remove the O-ring seal from the A/C pressure transducer fitting and discard.

INSTALLATION

NOTE: Replace the O-ring seal before installing the A/C pressure transducer.

- (1) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the A/C pressure transducer fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
- (2) Install and tighten the A/C pressure transducer onto the discharge line fitting. The transducer should be hand-tightened securely onto the discharge line fitting.
- (3) Connect the wire harness connector to the A/C pressure transducer.

BLEND DOOR ACTUATOR

DESCRIPTION

The blend door actuators are reversible, 12-volt Direct Current (DC), servo motors. Models with the single zone heater and air conditioner system have a single blend door, which is controlled by a single blend door actuator. Models with the optional dual zone front heater and air conditioner system have dual blend doors, which are controlled by two blend door actuators. The single zone blend door actuator is located on the driver side end of the HVAC housing, close to the dash panel. In the dual zone system, the same blend door actuator used for the single zone system becomes the driver side blend door actuator, and is mechanically connected to only the driver side blend door. In the dual zone system, a second separate blend door actuator is also located on the top of the HVAC housing and is mechanically connected to only the passenger side blend door.

The blend door actuators are interchangeable with each other, as well as with the actuators for the mode door, defrost door and the recirculation door. Each actuator is contained within an identical black

molded plastic housing with an integral wire connector receptacle. Integral mounting tabs allow the actuator to be secured with three screws to the HVAC housing. Each actuator also has an identical output shaft with splines that connects it to the linkage that drives the proper door. The blend door actuators do not require mechanical indexing to the blend door linkage, as they are electronically calibrated by the heater-A/C control module. The blend door actuators cannot be adjusted or repaired and, if damaged or faulty, they must be replaced.

OPERATION

Each blend door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector from the HVAC wire harness. The blend door actuator can move the blend-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction. When the A/C-heater control makes the voltage to both connections high or both connections low, the blend-air door stops and will not move. The motor connections also provide a feedback signal to the A/C-heater control. This feedback signal allows the A/C-heater control to monitor the operation and relative positions of the blend door actuator and the blend-air door. The A/C-heater control learns the blend door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuits.

The blend door actuator can be diagnosed using a DRBIII® scan tool. Refer to Body Diagnostic Procedures for more information. The blend door actuators cannot be adjusted or repaired and, if damaged or faulty, they must be replaced.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

BLEND DOOR ACTUATOR (Continued)

NOTE: The single zone heating and air conditioning system is equipped with a single blend door actuator. The dual zone system has two blend door actuators, one for the driver side blend air door and one for the passenger side blend air door. The same service procedures can be used for each of these actuators.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
- (3) Disconnect the wire harness connector from the blend door actuator(s) (Fig. 16).
- (4) Remove the screws that secure the blend door actuator(s) to the HVAC housing.
- (5) Remove the blend door actuator(s) from the HVAC housing.

INSTALLATION

- (1) Position the blend door actuator(s) into the HVAC housing. If necessary, rotate the actuator(s) slightly to align the splines on the actuator output sleeve(s) with those on the blend door linkage.
- (2) Install and tighten the screws that secure the blend door actuator(s) to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
- (3) Connect the HVAC wire harness connector to the blend door actuator(s).
- (4) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
- (5) Reconnect the battery negative cable.

BLOWER MOTOR RESISTOR BLOCK

DESCRIPTION

The blower motor resistor is mounted to the bottom side of the HVAC housing near the blower motor. It can be accessed for service from underneath the instrument panel.

OPERATION

The resistor has multiple resistor wires, each of which will reduce the current flow to the blower motor to change the blower motor speed by changing the resistance in the blower motor ground path. The blower motor switch directs the ground path through the correct resistor wire to obtain the selected speed.

With the blower motor switch in the lowest speed position, the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be repaired and, if faulty or damaged, it must be replaced.

BLOWER MOTOR RESISTOR BLOCK (Continued)

DIAGNOSIS AND TESTING - BLOWER MOTOR RESISTOR BLOCK

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

(1) Disconnect and isolate the negative battery cable.

(2) Disconnect the wire harness connector from the blower motor resistor block.

(3) Check for continuity between each of the blower motor switch input terminals of the resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor block.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CAUTION: Stay clear of the blower motor resistor block heat sink (Hot). Do not operate the blower motor with the resistor block removed.

(1) Disconnect and isolate the negative battery cable.

(2) Reach under the instrument panel near the blower motor and disconnect the wire harness connector from the blower motor resistor block.

(3) Remove the two screws that secure the blower motor resistor block to the HVAC housing.

(4) Remove the resistor block from the HVAC housing.

INSTALLATION

(1) Position the blower motor resistor block into the HVAC housing.

(2) Install the two screws that secure the resistor block to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Connect the wire harness connector to the resistor block.

(4) Reconnect the battery negative cable.

BLOWER MOTOR SWITCH

DESCRIPTION

The blower motor is controlled by a rotary-type blower motor switch, mounted in the A/C-heater control. The switch allows the selection of one of four different blower motor speeds and includes an Off position.

Fig. 18 A/C-Heater Control - Single Zone Shown, Dual Zone Typical

- 1 - MOUNTING TAB (4)
- 2 - A/C BUTTON
- 3 - SIDEVIEW MIRROR DEFROSTER BUTTON (IF EQUIPED)
- 4 - MODE CONTROL SWITCH
- 5 - TEMPERATURE CONTROL SWITCH
- 6 - BLOWER MOTOR SWITCH

OPERATION

The blower motor switch provides a blower motor ground path through the A/C-heater mode control switch. The blower motor switch directs this ground path through or around the blower motor resistor wires, as required to achieve the selected blower motor speed.

The blower motor switch cannot be repaired and, if faulty or damaged, the entire A/C-heater control must be replaced.

DIAGNOSIS AND TESTING - BLOWER MOTOR SWITCH

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISO-

LATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check for battery voltage at the fuse in the Power Distribution Center (PDC). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the A/C-heater control from the instrument panel (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL). Check for continuity between the ground circuit cavity of the A/C-heater control wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

(3) With the A/C-heater control wire harness connector disconnected, place the A/C-heater mode control switch in any position except the Off position. Check for continuity between the ground circuit terminal and each of the blower motor driver circuit terminals of the A/C-heater control as you move the blower motor switch to each of the four speed positions. There should be continuity at each driver circuit terminal in only one blower motor switch speed position. If OK, test and repair the blower driver circuits between the A/C-heater control connector and the blower motor resistor as required. If not OK, replace the faulty A/C-heater control.

DEFROST DOOR ACTUATOR

DESCRIPTION

The defrost door actuator is a reversible, 12-volt Direct Current (DC), servo motor. The defrost door actuator is located on the driver side end of the HVAC housing, underneath the instrument panel and is mechanically connected to the defroster door.

The defrost door actuator is interchangeable with the actuators for the mode door, blend door(s) and the recirculation door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Integral mounting tabs allow the actuator to be secured with three screws to the HVAC housing. Each actuator also has an identical output shaft with splines that connects it to the linkage that drives the proper door. The defrost door actuator does not require mechani-

DEFROST DOOR ACTUATOR (Continued)

cal indexing to the defrost door, as it is electronically calibrated by the heater-A/C control module. The defrost door actuator cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

OPERATION

The defrost door actuator is connected to the heater-A/C control module through the vehicle electrical system by a dedicated two-wire lead and connector from the HVAC wire harness. The defrost door actuator can move the defrost door in two directions. When the heater-A/C control module pulls the voltage on one side of the motor connection high and the other connection low, the defrost door will move in one direction. When the module reverses the polarity of the voltage to the motor, the defrost door moves in the opposite direction. When the module makes the voltage to both connections high or both connections low, the defrost door stops and will not move. These same motor connections also provide a feedback signal to the heater-A/C control module. This feedback signal allows the module to monitor the operation and relative positions of the defrost door actuator and the defrost door. The heater-A/C control module learns the defrost door stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the defrost door actuator circuits. The defrost door actuator can be diagnosed using a DRBIII® scan tool. Refer to Body Diagnostic Procedures.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) Disconnect the wire harness connector from the defrost door actuator (Fig. 19).

(4) Remove the screws that secure the defrost door actuator to the HVAC housing.

(5) Remove the defrost door actuator from the HVAC housing.

(3) Connect the HVAC wire harness connector to the defrost door actuator.

(4) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(5) Reconnect the battery negative cable.

EVAPORATOR TEMPERATURE SENSOR

DESCRIPTION

The evaporator temperature sensor is a two-wire temperature sensing element located at the coldest point on the face of the evaporator. The sensor is attached to the evaporator coil fins. The evaporator temperature sensor prevents condensation on the evaporator coil from freezing and obstructing A/C system air flow. The evaporator temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The evaporator temperature sensor monitors the temperature of the evaporator. The sensor will change its internal resistance in response to the temperatures it monitors. The A/C-heater control module is connected to the sensor through a sensor ground circuit and a sensor signal circuit. As the evaporator temperature increases, the resistance of the sensor decreases and the voltage monitored by the module decreases. The module uses this monitored voltage reading to an indication of the evaporator temperature. The A/C-heater control module is programmed to respond to this input by cycling the air conditioning compressor clutch as necessary to optimize air conditioning system performance and to protect the system from evaporator freezing. The external location of the sensor allows the sensor to be removed or installed without disturbing the refrigerant in the system. The evaporator temperature sensor is diagnosed using a DRBIII® scan tool. Refer to Body Diagnostic Procedures.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the HVAC housing from the vehicle (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(3) Disconnect the HVAC wire harness connector from the evaporator temperature sensor (Fig. 20).

(4) Disassemble the HVAC housing to gain access to the evaporator coil (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY).

(5) Remove the evaporator temperature sensor probe from the evaporator coil (Fig. 21).

INSTALLATION

(1) Install the evaporator temperature sensor probe into the evaporator coil.

MODE DOOR ACTUATOR

DESCRIPTION

The mode door actuator is a reversible 12-volt Direct Current (DC) servo motor. The mode door actuator is located on the HVAC housing, behind the instrument panel and is mechanically connected to the mode door.

The mode door actuator is interchangeable with the actuators for the blend door(s), defrost door and the recirculation door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Integral mounting tabs allow the actuator to be secured with three screws to the HVAC housing. Each actuator also has an identical output shaft with splines that connects it to the linkage that drives the proper door. The mode door actuator does not require mechanical indexing to the mode door linkage, as it is electronically calibrated by the heater-A/C control module. The mode door actuator cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

OPERATION

The mode door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector from the HVAC wire harness. The mode door actuator can move the mode door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the mode door moves in the opposite direction. When the A/C-heater control makes the voltage to both connections high or both connections low, the mode door stops and will not move. These same motor connections also provide a feedback signal to the A/C-heater control. This feedback signal allows the A/C-heater control to monitor the operation and relative position of the mode door actuator and the mode door. The A/C-heater control learns the mode door stop positions during the calibration procedure and will store a diagnostic trouble

code (DTC) for any problems it detects in the mode door actuator circuits.

The mode door actuator can be diagnosed using a DRBIII® scan tool. Refer to Body Diagnostic Procedures for more information. The mode door actuator cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) Disconnect the wire harness connector from the mode door actuator (Fig. 22).

(4) Remove the screws that secure the mode door actuator to the HVAC housing.

(5) Remove the mode door actuator from the HVAC housing.

INSTALLATION

(1) Position the mode door actuator onto the HVAC housing. If necessary, rotate the actuator slightly to align the splines on the actuator output sleeve with those on the mode door linkage.

(2) Install and tighten the screws that secure the mode door actuator to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Connect the HVAC wire harness connector to the mode door actuator.

(4) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(5) Reconnect the battery negative cable.

RECIRCULATION DOOR ACTUATOR

DESCRIPTION

The recirculation door actuator is a reversible 12-volt Direct Current (DC) servo motor. The single recirculation door actuator is located on the passenger side end of the HVAC housing, on the top of the air inlet housing. The recirculation door actuator is mechanically connected to the recirculation air door. The recirculation door actuator is interchangeable with the actuators for the blend door(s), defrost door and the mode door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Integral mounting tabs allow the actuator to be secured with three screws to air inlet housing. Each actuator also has an identical output shaft with splines that connects it to

the linkage that drives the proper door. The recirculation door actuator does not require mechanical indexing to the recirculation door linkage, as it is electronically calibrated by the heater-A/C control module. The recirculation door actuator cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

OPERATION

The recirculation door actuator is connected to the heater-A/C control module through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The recirculation door actuator can move the recirculation door in two directions. When the heater-A/C control module pulls the voltage on one side of the motor connection high and the other connection low, the recirculation air door will move in one direction. When the module reverses the polarity of the voltage to the motor, the recirculation air door moves in the opposite direction. When the module makes the voltage to both connections high or both connections low, the recirculation air door stops and will not move. These same motor connections also provide a feedback signal to the heater-A/C control module. This feedback signal allows the module to monitor the operation and relative position of the recirculation door actuator and the recirculation air door. The heater-A/C control module learns the recirculation air door stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the recirculation door actuator circuits.

The recirculation door actuator can be diagnosed using a DRBIII® scan tool. Refer to Body Diagnostic Procedures for more information. The recirculation door actuator cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable.

RECIRCULATION DOOR ACTUATOR (Continued)

(2) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

(3) Disconnect the wire harness connector from the recirculation door actuator (Fig. 23).

(4) Remove the screws that secure the recirculation door actuator to the air inlet housing.

(5) Remove the recirculation door actuator from the air inlet housing.

INSTALLATION

(1) Position the recirculation door actuator onto the air inlet housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the recirculation air door.

(2) Install and tighten the screws that secure the recirculation door actuator to the air inlet housing. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Connect the HVAC wire harness connector to the recirculation door actuator.

(4) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(5) Reconnect the battery negative cable.

AIR OUTLETS

DESCRIPTION

There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle, and two located near the top of the instrument panel center bezel. The air outlets can be removed individually for service replacement.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

AIR OUTLETS (Continued)

NOTE: The instrument panel air outlets are retained into the outlet housings by a light snap fit.

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry the panel air outlet(s) out of the panel outlet housing(s) as required (Fig. 1).

- 11 - CUP HOLDERS
- 12 - ASH TRAY (IF EQUIPPED)
- 13 - POWER OUTLET

INSTALLATION

(1) Position the air outlet(s) onto the outlet housing(s).

(2) Gently push the air outlet into the housing until it snaps into position.

BLEND DOOR

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Vehicles equipped with single zone HVAC systems have one blend door, dual zone systems have two blend doors.

(1) Remove the HVAC housing from the vehicle (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(2) Disassemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY).

(3) Remove the levers from the driver and/or passenger side blend door (if equipped) (Fig. 2).

(4) Gently slide the drivers and/or passenger side blend door toward the out side of the housing. Tilt and lift the door(s) out of the housing.

(5) Inspect the blend door(s), seals and the HVAC housing for damage or binding and repair or replace components as required.

- 4 - HVAC HOUSING
- 5 - A/C EVAPORATOR
- 6 - EVAPORATOR TEMPERATURE SENSOR PROBE
- 7 - DRIVER SIDE BLEND DOOR
- 8 - DRIVER SIDE BLEND DOOR LEVER

INSTALLATION

(1) Position the blend door pivot shafts into the pivot hole and actuator in the bottom of the lower half of the HVAC housing.

(2) Install the blend door(s) by carefully tipping the doors into the HVAC housing, then sliding each door into it's operating position.

(3) Install the levers to the driver and/or passenger side blend door (if equipped).

(4) Assemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY)

BLEND DOOR (Continued)

(5) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

BLOWER MOTOR

DESCRIPTION

The blower motor and blower wheel are located in the passenger side end of the HVAC housing, below the glove box. The blower motor controls the velocity of air flowing through the HVAC housing by spinning a squirrel cage-type blower wheel within the housing at the selected speed. The blower motor and wheel can be removed from the housing inside the vehicle without removing the instrument panel or HVAC housing.

OPERATION

The blower motor will only operate with the ignition switch in the On position and the A/C-heater mode control switch in any position, except Off. The blower motor receives a fused battery feed circuit through a fuse in the Power Distribution Center (PDC) whenever the ignition switch is in the On position. Blower motor speed is controlled by regulating the ground path through or around the blower motor resistor block and through the A/C-heater blower motor switch.

The blower motor and blower motor wheel are serviced only as a unit and cannot be repaired and, if faulty or damaged, must be replaced.

DIAGNOSIS AND TESTING - BLOWER MOTOR

BLOWER MOTOR INOPERATIVE

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring, diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

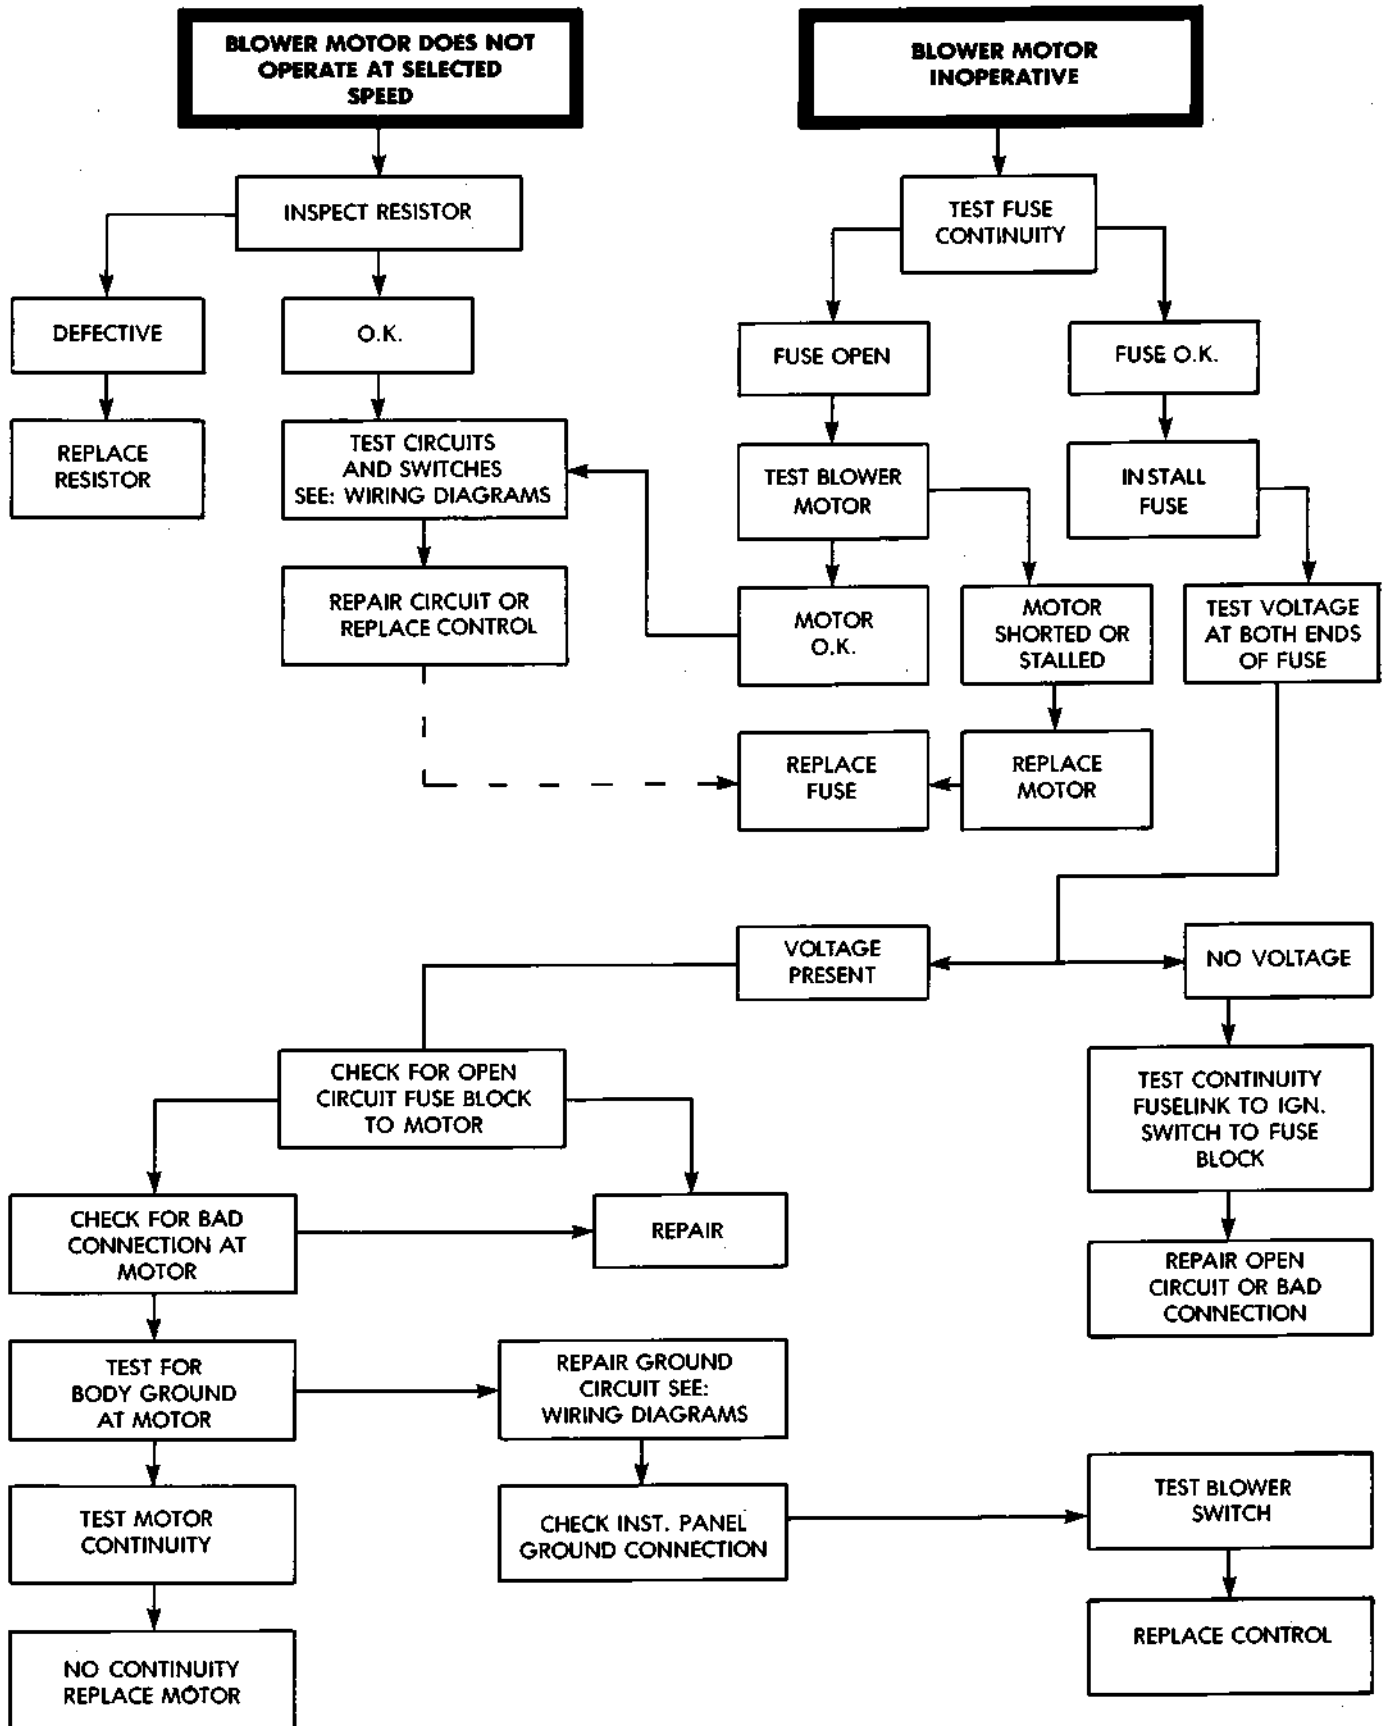

BLOWER MOTOR ELECTRICAL DIAGNOSIS

Refer to the Blower Motor Electrical Diagnosis chart for basic checks of the blower motor circuit (Fig. 3).

BLOWER MOTOR NOISE OR VIBRATION

Refer to the Blower Motor Noise/Vibration Diagnosis chart for basic checks of the blower motor when a vibration or noise is present (Fig. 4).

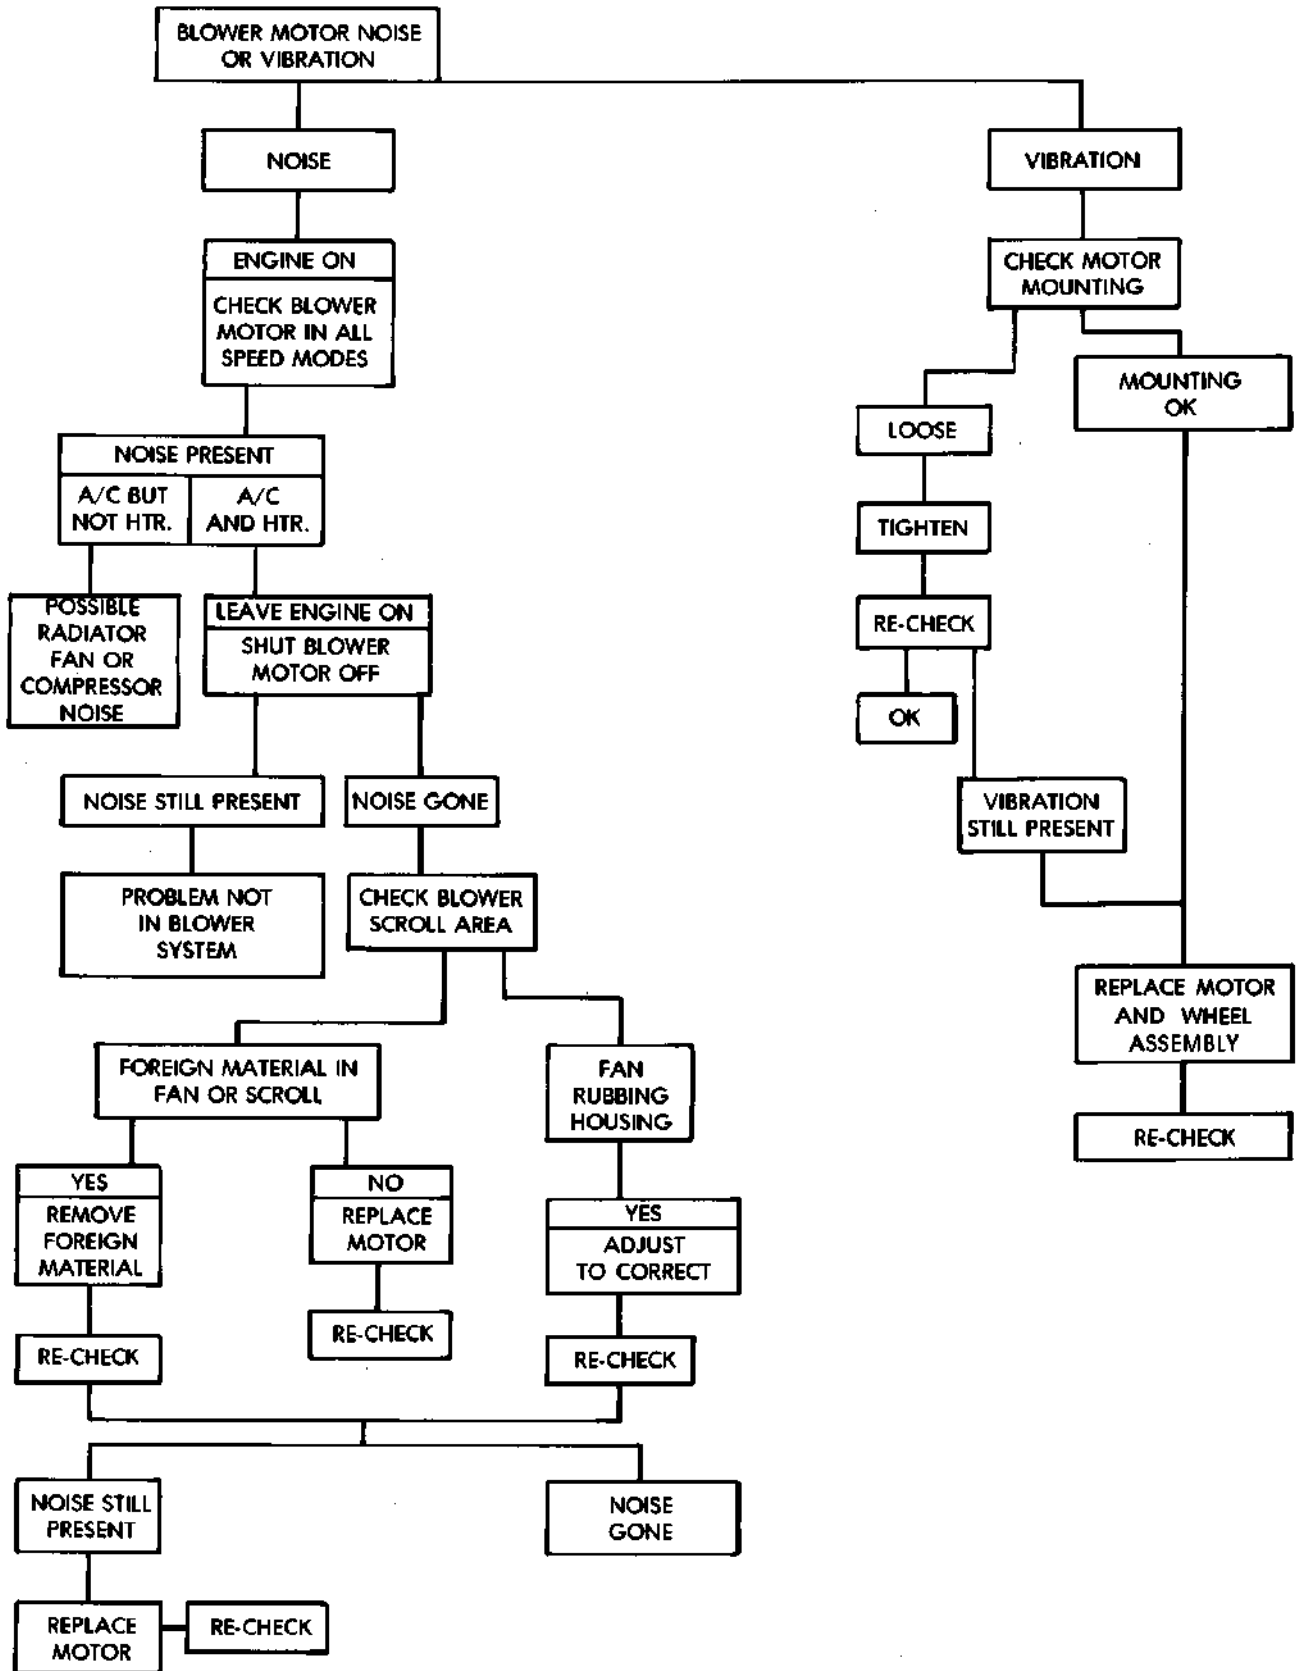

BLOWER MOTOR (Continued)

BLOWER MOTOR (Continued)

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: The blower motor is located on the passenger side of the vehicle under the instrument panel. The blower motor can be removed from the vehicle without having to remove the HVAC housing.

- (1) Disconnect and isolate the battery negative cable.
- (2) Disconnect the wire harness connector from the blower motor. (Fig. 5).
- (3) Remove the three screws that secure the blower motor to the HVAC housing.
- (4) Remove the blower motor from the HVAC housing by rotating and tilting the blower motor as needed for clearance.

INSTALLATION

- (1) Align and install the blower motor into the HVAC housing.
- (2) Install the three screws that secure the blower motor to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (3) Connect the wire harness connector to the blower motor.
- (4) Reconnect the battery negative cable.

DEFROST DOOR

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS

IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Remove the HVAC housing from the vehicle (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).
- (2) Disassemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY).
- (3) Remove the defrost door actuator and sleeve from the lower half of the HVAC housing (Fig. 6).
- (4) Gently slide the defrost door toward the outside of the housing. Tilt and lift the door out of the housing.
- (5) Inspect the defrost door, seals and the HVAC housing for damage or binding and repair or replace components as required.

INSTALLATION

- (1) Position the defrost door pivot shaft into the pivot hole in the lower half of the HVAC housing.
- (2) Install the defrost door actuator and sleeve.
- (3) Assemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY).
- (4) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

(1) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(2) Disconnect the wire harness connector from the center radio speaker (Fig. 7).

(3) Position the speaker wire harness connector out of the way.

(4) Remove the screw that secures the defroster duct adapter to the instrument panel support.

(5) Remove the defroster duct adapter from the defroster duct.

(6) Remove the six screws that secure the defroster duct to the instrument panel.

(7) Remove the defroster duct from the instrument panel.

INSTALLATION

(1) Install the defroster duct into the instrument panel.

(2) Install the six screws that secure the defroster duct to the instrument panel. Tighten the screws to 2.2 N·m (20 in.lbs.).

(3) Install the defroster duct adapter onto the defroster duct.

(4) Install the screw that secures the defroster duct adapter to the instrument panel support. Tighten the screw to 2.2 N·m (20 in.lbs.).

(5) Connect the wire harness connector to the center radio speaker.

(6) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

DEFROSTER DUCT

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

FLOOR DISTRIBUTION DUCT (Continued)

INSTALLATION

- (1) Install the floor distribution duct onto the bottom of the HVAC housing.
- (2) Install the five screws that secure the floor distribution duct to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (3) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

HVAC HOUSING

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: The HVAC housing must be removed from the vehicle and the two halves of the housing separated for service access of the heater core, evaporator coil, defrost door, blend door(s) and the recirculation door.

- (1) Disconnect and isolate the battery negative cable.
- (2) Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).
- (4) Disconnect the liquid refrigerant line fitting from the evaporator inlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - REMOVAL). Discard the O-ring seal and install plugs in, or tape over the opened liquid refrigerant line fitting and evaporator inlet tube.
- (5) Remove the accumulator (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - REMOVAL). Discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and evaporator outlet tube.

(6) Disconnect the heater hoses from the heater core tubes. Install plugs in, or tape over the opened heater core tubes.

(7) Remove the powertrain control module (PCM) from the engine compartment to gain access to the HVAC housing retaining nuts (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - REMOVAL).

(8) Remove the two nuts from the HVAC housing mounting studs in the engine compartment.

(9) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(10) Remove the bolt that secures the HVAC housing to the floor bracket located in the center of the vehicle (Fig. 9).

(11) Remove the two nuts from the HVAC housing mounting studs in the passenger compartment.

(12) Remove the HVAC housing from inside the vehicle. Take care not to allow any remaining coolant to drain onto the vehicles interior.

HVAC HOUSING (Continued)

DISASSEMBLY

(1) Remove the HVAC housing from the vehicle and place it on the workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(2) Disconnect the electrical connectors from the blower motor, blower motor resistor block, evaporator temperature sensor and each actuator (Fig. 10).

(3) Remove the HVAC wiring harness from the HVAC housing.

(4) If necessary, remove the blower motor from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/BLOWER MOTOR - REMOVAL).

(5) If necessary, remove the blower motor resistor block from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/BLOWER MOTOR RESISTOR BLOCK - REMOVAL).

(6) Carefully remove the foam seals from the heater core and evaporator coil tube mounting flange of the HVAC housing. If either seal is deformed or damaged, it must be replaced.

(7) Remove the screws that secure the heater core in the HVAC housing and carefully remove the heater core from the housing (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/HEATER CORE - REMOVAL).

(8) Use a screwdriver to pry off the four snap clips that help secure the upper and lower HVAC housing halves together.

(9) Remove the screws that secure the upper and lower HVAC housing halves to each other and those that secure the recirculation housing to the upper HVAC housing.

(10) Carefully separate the recirculation housing and the upper HVAC housing from the lower housing.

ASSEMBLY

(1) Position the upper HVAC housing to the lower housing. During assembly, be certain of the following:

(a) That each of the door pivot shaft ends are properly engaged in their pivot holes.

(b) That the evaporator drain opening is clean and the drain foam seal is properly installed.

(2) Install the screws and snap clips that secure the upper and lower HVAC housing halves to each other and those that secure the recirculation housing to the upper HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Install the foam seals on the heater core and evaporator coil tubes.

(4) If removed, install the blower motor resistor block (Refer to 24 - HEATING & AIR CONDITION-

ING/CONTROLS/BLOWER MOTOR RESISTOR BLOCK - INSTALLATION).

(5) If removed, install the blower motor (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/BLOWER MOTOR - INSTALLATION).

(6) Install the HVAC wire harness. Make sure the wires are routed through all wiring retainers.

(7) Connect the wire harness to the blower motor, blower motor resistor block, evaporator temperature sensor and each actuator.

(8) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

INSTALLATION

WARNING: IF THE VEHICLE IS EQUIPPED WITH AIR CONDITIONING, REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)

(1) Position the HVAC housing into the vehicle. Be certain that the evaporator condensate drain tube and the housing mounting studs are inserted into their correct locations.

(2) Install the two nuts that secure the HVAC housing to the mounting studs in the passenger compartment. Tighten the nuts to 6.2 N·m (55 in. lbs.).

(3) Install the bolt that secures the HVAC housing to the floor bracket in the passenger compartment. Tighten the bolt to 6.2 N·m (55 in. lbs.).

(4) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(5) Install the two nuts that secure the HVAC housing to the mounting studs in the engine compartment. Tighten the nuts to 6.2 N·m (55 in. lbs.).

(6) Install the powertrain control module (PCM) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - INSTALLATION).

(7) Unplug or remove the tape from the heater core tubes and connect the heater hoses to the heater core tubes.

(8) Unplug or remove the tape from the opened refrigerant line fittings and the evaporator outlet tube and install the accumulator (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - INSTALLATION).

(9) Unplug or remove the tape from the liquid line and the evaporator inlet tube fittings. Connect the liquid line coupler to the evaporator inlet tube (Refer

to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS).

(10) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(11) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

(12) Fill the engine cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(13) Connect the battery negative cable.

(14) Start the engine and check for proper operation of the heating and air conditioning systems.

INSTRUMENT PANEL
DEMISTER DUCTS

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the defroster ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - REMOVAL).

(2) Remove the two screws that secure the center distribution duct to the instrument panel support.

(3) Remove the center distribution duct from instrument panel support, panel ducts and demister ducts.

(4) Remove the right side panel duct adapter (Fig. 11).

(5) Remove the right side intermediate demister duct.

(6) Remove the left side intermediate demister duct.

(7) Remove the left side panel duct adapter.

(8) Remove the instrument panel cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

INSTRUMENT PANEL DEMISTER DUCTS (Continued)

(9) Remove the screws that secure the left and right side panel ducts to the instrument panel.

(10) Remove the left and right side panel ducts from the instrument panel.

(11) Remove the screws that secure the left and right side demister ducts to the instrument panel.

(12) Remove the left and right side demister ducts from the instrument panel.

(11) Install the two screws that secure the center distribution duct to the instrument panel support. Tighten the screws to 2.2 N·m (20 in. lbs.).

(12) Install the defroster ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - INSTALLATION).

INSTRUMENT PANEL DUCTS

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the defroster ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - REMOVAL).

(2) Remove the two screws that secure the center distribution duct to the instrument panel support.

(3) Remove the center distribution duct from instrument panel support, panel ducts and demister ducts.

(4) Remove the right side panel duct adapter (Fig. 12).

(5) Remove the right side intermediate demister duct.

(6) Remove the left side intermediate demister duct.

(7) Remove the left side panel duct adapter.

(8) Remove the instrument panel cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(9) Remove the screws that secure the left and right side panel ducts to the instrument panel.

(10) Remove the left and right side panel ducts from the instrument panel.

INSTALLATION

(1) Install the left and right side panel ducts to the instrument panel.

(2) Install the screws that secure the left and right side panel ducts to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

- (4) Install the left side panel duct adapter.
- (5) Install the left side intermediate demister duct.
- (6) Install the right side intermediate demister duct.
- (7) Install the right side panel duct adapter.
- (8) Install the center distribution duct to the instrument panel support.
- (9) Install the two screws that secure the center distribution duct to the instrument panel support. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (10) Install the defroster ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - INSTALLATION).

MODE DOOR

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
- (2) Remove the mode door actuator and sleeve from the upper half of the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - REMOVAL).
- (3) Remove the two screws that secure the mode door adapter to the top the HVAC housing (Fig. 13).
- (4) Disconnect the two plastic retainer clips that secure the mode door adapter to the front the HVAC housing and remove the mode door adapter.
- (5) Remove the screws that secure the two mode door spring retainers to the top the HVAC housing and remove the retainers.
- (6) Remove the mode door cover from the top the HVAC housing.
- (7) Gently slide the mode door toward the outside of the housing. Tilt and lift the door out of the housing.
- (8) Inspect the mode door, seals and the HVAC housing for damage or binding and repair or replace components as required.

INSTALLATION

- (1) Position the mode door pivot shaft into the pivot hole in the upper half of the HVAC housing.
- (2) Install the mode door by carefully tipping the door into the HVAC housing, then sliding the door into it's operating position.
- (3) Install the mode door cover onto the top the HVAC housing.
- (4) Install the screws that secure the mode door spring retainers to the top the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (5) Install the mode door adapter to the top the HVAC housing. Connect the two plastic retainer clips

MODE DOOR (Continued)

that secure the mode door adapter to the front the HVAC housing.

(6) Install the two screws that secure the mode door adapter to the top of the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(7) Install the mode door actuator and sleeve to the upper half of the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - INSTALLATION).

(8) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

RECIRCULATION DOOR

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the HVAC housing from the vehicle and place it on the workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(2) Remove the recirculation door actuator from the recirculation housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RECIRCULATION DOOR ACTUATOR - REMOVAL).

(3) Remove the two screws and disengage the two plastic retaining tabs that secure the recirculation housing to the HVAC housing (Fig. 14).

(4) Remove the recirculation housing from the HVAC housing.

(5) Gently slide the recirculation door toward the outside of the recirculation housing. Tilt and lift the door out of the housing.

(6) Inspect the recirculation door, seals and the HVAC recirculation housing for damage or binding and repair or replace components as required.

RECIRCULATION DOOR (Continued)

- 4 - SCREW (2)
- 5 - HVAC HOUSING
- 6 - RETAINER (2)

INSTALLATION

(1) Position the recirculation door pivot shaft into the pivot hole in the recirculation housing.

(2) Install the recirculation door by carefully tipping the door into the housing, then sliding the door into its operating position.

(3) Install the recirculation housing onto the HVAC housing.

(4) Engage the two plastic retainer clips that secure the recirculation housing to the front the HVAC housing.

(5) Install the two screws that secure the recirculation housing to the top the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(6) Install the recirculation door actuator (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RECIRCULATION DOOR ACTUATOR - INSTALLATION).

(7) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

PLUMBING

DESCRIPTION - REFRIGERANT LINE

The refrigerant lines and hoses are used to carry the refrigerant between the various air conditioning system components. A barrier hose design with a nylon tube, which is sandwiched between rubber layers, is used for the R-134a air conditioning system on this vehicle. This nylon tube helps to further contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant hoses are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from an exhaust manifold.

OPERATION- REFRIGERANT LINES

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled with other components of the HVAC system with either O-rings or dual plane seals.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

WARNING

ENGINE COOLING SYSTEM

WARNING: THE ENGINE COOLING SYSTEM IS DESIGNED TO DEVELOP INTERNAL PRESSURES OF 97 TO 123 KILOPASCALS (14 TO 18 POUNDS PER SQUARE INCH). DO NOT REMOVE OR LOOSEN THE COOLANT PRESSURE CAP, CYLINDER BLOCK DRAIN PLUGS, RADIATOR DRAIN, RADIATOR HOSES, HEATER HOSES, OR HOSE CLAMPS WHILE THE ENGINE COOLING SYSTEM IS HOT AND UNDER PRESSURE. FAILURE TO OBSERVE THIS WARNING CAN RESULT IN SERIOUS BURNS FROM THE HEATED ENGINE COOLANT. ALLOW THE VEHICLE TO COOL FOR A MINIMUM OF 15 MINUTES BEFORE OPENING THE COOLING SYSTEM FOR SERVICE.

PLUMBING (Continued)

A/C SYSTEM

WARNING: THE AIR CONDITIONING SYSTEM CONTAINS REFRIGERANT UNDER HIGH PRESSURE. SEVERE PERSONAL INJURY MAY RESULT FROM IMPROPER SERVICE PROCEDURES. REPAIRS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL.

AVOID BREATHING THE REFRIGERANT AND REFRIGERANT OIL VAPOR OR MIST. EXPOSURE MAY IRRITATE THE EYES, NOSE, AND/OR THROAT. WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM DIRECT CONTACT WITH THE REFRIGERANT. IF EYE CONTACT OCCURS, SEEK MEDICAL ATTENTION IMMEDIATELY.

DO NOT EXPOSE THE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC LEAK DETECTOR IS RECOMMENDED.

IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE THE WORK AREA BEFORE RESUMING SERVICE. LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION. THE EVAPORATION RATE OF R-134a REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT THE SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH THE REFRIGERANT.

THE R-134a SERVICE EQUIPMENT OR THE VEHICLE REFRIGERANT SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS, AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

CAUTION

A/C SYSTEM

CAUTION: Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.

Never add R-12 to a refrigerant system designed to use R-134a and do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.

R-12 refrigerant oil must not be mixed with R-134a

refrigerant oil. They are not compatible and damage to the system will result.

Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause noise and system failure. Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.

Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

Keep service tools and the work area clean. Contamination of the refrigerant system must be avoided.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C systems. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

PLUMBING (Continued)

DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS

WARNING: R-134a SERVICE EQUIPMENT OR VEHICLE A/C SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. MIXTURE OF AIR and R-134a CAN BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

AVOID BREATHING A/C REFRIGERANT AND LUBRICANT VAPOR OR MIST. EXPOSURE MAY IRRITATE EYES, NOSE AND THROAT. USE ONLY APPROVED SERVICE EQUIPMENT MEETING SAE REQUIREMENTS TO DISCHARGE R-134a SYSTEM. IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE WORK AREA BEFORE RESUMING SERVICE.

NOTE: The refrigerant system does come from the factory with a yellow tracer dye already installed to aid in detection of leaks.

If the A/C system is not cooling properly, determine if the refrigerant system is fully charged with R-134a. This is accomplished by performing a system Charge Level-Check or Fill. If while performing this test A/C liquid line pressure is less than 345 kPa (50 psi) proceed to System Empty procedure. If liquid line pressure is greater than 345 kPa (50 psi) proceed to System Low procedure. If the refrigerant system is empty or low in refrigerant charge, a leak at any line fitting or component seal is likely. A review of the fittings, lines and components for oily residue is an indication of the leak location. To detect a leak in the refrigerant system, perform one of the following procedures as indicated by the symptoms.

SYSTEM EMPTY

(1) Evacuate the refrigerant system to the lowest degree of vacuum possible (approx. 28 in Hg.). Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed with this procedure.

(2) Prepare a 0.284 Kg. (10 oz.) refrigerant charge to be injected into the system.

(3) Connect and dispense 0.284 Kg. (10 oz.) of refrigerant into the evacuated refrigerant system.

(4) Proceed to Step 2 of System Low procedure.

SYSTEM LOW

(1) Determine if there is any (R-134a) refrigerant in the system.

(2) Position the vehicle in a wind free work area. This will aid in detecting small leaks.

(3) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run for five minutes with the system set to the following:

- Transmission in Park or Neutral with parking brake set
- Engine idling at 700 rpm
- A/C controls set in 100 percent outside air
- Blower switch in the high A/C position
- A/C in the ON position
- Open all windows

CAUTION: A leak detector designed for R-12 refrigerant (only) will not detect leaks in a R-134a refrigerant system.

(4) Shut off the vehicle and wait 2 to 7 minutes. Then use an Electronic Leak Detector that is designed to detect R-134a type refrigerant and search for leaks. Fittings, lines, or components that appear to be oily usually indicates a refrigerant leak. To inspect the evaporator core for leaks, insert the leak detector probe into the drain tube opening or a heat duct. A R-134a dye is available to aid in leak detection, use only DaimlerChrysler approved refrigerant dye.

PLUMBING (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURE - HANDLING TUBING AND FITTINGS

CAUTION: The system must be completely empty before opening any fitting or connection in the refrigeration system. Open fittings with caution even after the system has been emptied. If any pressure is noticed as a fitting is loosened, retighten fitting and evacuate the system again.

A good rule for the flexible hose lines is to keep the radius of all bends at least 10 times the diameter of the hose. Sharper bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 3 inches (80 mm) from the exhaust manifold. Inspect all flexible hose lines to make sure they are in good condition and properly routed.

The use of correct wrenches when making connections is very important. Improper wrenches or improper use of wrenches can damage the fittings. The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.

When opening a refrigeration system, have everything you will need to repair the system ready. This will minimize the amount of time the system must be opened. Cap or plug all lines and fittings as soon as they are opened. This will help prevent the entrance of dirt and moisture. All new lines and components should be capped or sealed until they are ready to be used. Before connecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.

All tools, including the refrigerant dispensing manifold, the manifold gauge set, and test hoses should be kept clean and dry.

Kinks in the refrigerant tubing or sharp bends in the refrigerant hose lines will greatly reduce the capacity of the entire system. High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all connections are pressure tight. Dirt and moisture can enter the system when it is opened for repair or replacement of lines or components. The refrigerant oil will

absorb moisture readily out of the air. This moisture will convert into acids within a closed system.

STANDARD PROCEDURE - DIODE REPLACEMENT

(1) Disconnect and isolate the battery negative cable. If the vehicle has dual batteries, remove the negative cable from both batteries.

(2) Locate the diode in the harness, and remove the protective covering.

(3) Remove the diode from the harness. Note the direction of current flow (Fig. 1).

948W-197

Fig. 1 Diode Identification

- 1 - CURRENT FLOW
- 2 - BAND INDICATES CURRENT FLOW
- 3 - DIODE AS SHOWN IN WIRING DIAGRAMS

(4) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.

(5) Install the new diode in the harness, making sure current flow is correct. If necessary refer to the appropriate wiring diagram for current flow.

(6) Solder the connections together using rosin core type solder only. **Do not use acid core solder.**

(7) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.

(8) Reconnect the battery negative cable(s) and test the affected systems.

PLUMBING (Continued)

STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: EYE PROTECTION MUST BE WORN WHEN SERVICING AN AIR CONDITIONING REFRIGERANT SYSTEM. TURN OFF (ROTATE CLOCKWISE) ALL VALVES ON THE EQUIPMENT BEING USED BEFORE CONNECTING TO, OR DISCONNECTING FROM THE REFRIGERANT SYSTEM. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

When servicing the air conditioning system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used (Fig. 2). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

Fig. 2 Refrigerant Recovery/Recycling Station - Typical

1 - R-134a REFRIGERANT STATION

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 3). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

80add30c

Fig. 3 MANIFOLD GAUGE SET - TYPICAL

- 1 - HIGH PRESSURE GAUGE
- 2 - VALVE
- 3 - VACUUM/REFRIGERANT HOSE (YELLOW W/ BLACK STRIPE)
- 4 - HIGH PRESSURE HOSE (RED W/ BLACK STRIPE)
- 5 - LOW PRESSURE HOSE (BLUE W/ BLACK STRIPE)
- 6 - VALVE
- 7 - LOW PRESSURE GAUGE

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

LOW PRESSURE GAUGE HOSE The low pressure hose (Blue with Black stripe) attaches to the low side service port. This service port is located on the suction line between the accumulator outlet port and the A/C compressor.

HIGH PRESSURE GAUGE HOSE The high pressure hose (Red with Black stripe) attaches to the high side service port. This service port is located on the discharge line near the A/C compressor. On this model, an A/C pressure transducer is installed onto the high pressure service port. A/C high side pressures can be read using a DRBIII® scan tool. Refer to Body Diagnostic Procedures.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

PLUMBING (Continued)

STANDARD PROCEDURE - REFRIGERANT RECOVERY

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the compressor.

If a compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the air conditioner and damage the compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Recover the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(2) Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment.

(3) Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads -88 kPa (- 26 in. Hg) vacuum or greater

for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.

(4) Close all valves. Turn off and disconnect the vacuum pump.

(5) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE

WARNING: REVIEW SAFETY PRECAUTIONS AND WARNINGS IN THIS GROUP BEFORE CHARGING THE REFRIGERANT SYSTEM.

AVOID BREATHING A/C REFRIGERANT AND LUBRICANT VAPOR OR MIST. EXPOSURE MAY IRRITATE EYES, NOSE AND THROAT. USE ONLY APPROVED SERVICE EQUIPMENT MEETING SAE REQUIREMENTS TO DISCHARGE R-134a SYSTEM. IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE WORK AREA BEFORE RESUMING SERVICE.

R-134a SERVICE EQUIPMENT OR VEHICLE A/C SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. MIXTURE OF AIR and R-134a CAN BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

CAUTION: Do not overcharge refrigerant system, as excessive compressor head pressure can cause noise and system failure.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.

The procedure below should be used to fill the refrigerant charge in the air conditioning system. This A/C system does not have or use a sight glass to check or charge the system.

PLUMBING (Continued)

After the system has been tested for leaks and evacuated, a refrigerant (R-134a) charge can be injected into the system.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) If using a separate vacuum pump close all valves before disconnecting pump. Connect manifold gauge set to the A/C service ports.

NOTE: Always refer to the underhood HVAC Specification label for the refrigerant fill level of the vehicle being serviced.

(2) Measure refrigerant (refer to capacities). Refer to the instructions provided with the equipment being used.

(3) Verify engine is shut off. Open the suction and discharge valves. Open the charge valve to allow the refrigerant to flow into the system. When the transfer of refrigerant has stopped, close the suction and discharge valve.

(4) If all of the charge did not transfer from the dispensing device, put vehicle controls into the following mode:

- Automatic transmission in park or manual transmission in neutral
- Engine at idle
- A/C mode control set to outside air
- A/C mode control set to panel mode
- A/C temperature control set to full cool
- Blower motor control set on highest speed
- Vehicle windows closed

If the A/C compressor does not engage, test the compressor clutch control circuit and correct any failure (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING).

(5) Open the suction valve to allow the remaining refrigerant to transfer to the system.

WARNING: TAKE CARE NOT TO OPEN THE DISCHARGE (HIGH-PRESSURE) VALVE AT THIS TIME.

(6) Close all valves and test the A/C system performance.

(7) Disconnect the charging station or manifold gauge set. Install the service port caps.

REFRIGERANT CHARGE CAPACITY

The R-134a refrigerant system charge capacity for this vehicle can be found on the underhood HVAC specification tag.

A/C COMPRESSOR

DESCRIPTION

DESCRIPTION - A/C COMPRESSOR

The A/C system on models equipped with the 5.9L engine use a Sanden SD-7 reciprocating swash plate-type compressor. This compressor has a fixed displacement of 165 cubic centimeter (10.068 cubic inches) and has both the suction and discharge ports located on the cylinder head.

The A/C system on models equipped with the 3.7L, 4.7L and 5.7L engines use a Denso 10S17 reciprocating swash plate-type compressor. This compressor has a fixed displacement of 170 cubic centimeter and has both the suction and discharge ports located on the cylinder head.

A label identifying the use of R-134a refrigerant is located on both A/C compressors.

DESCRIPTION - HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head, which is on the rear of the compressor. This mechanical valve is designed to vent refrigerant from the system to protect against damage to the compressor and other system components, caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

OPERATION - A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be replaced. The compressor clutch, pulley and clutch coil are available for service.

OPERATION - HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents the system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The valve closes

A/C COMPRESSOR (Continued)

when a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the system. If the valve vents refrigerant, it does not mean that the valve is faulty.

The high pressure relief valve is a factory-calibrated unit. The valve cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the compressor assembly.

DIAGNOSIS AND TESTING - A/C COMPRESSOR

When investigating an air conditioning related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during air conditioning operation can often be misleading. For example: What sounds like a failed front bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets, or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon belt tension, belts can develop noises that are mistaken for a compressor noise. Improper belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the serpentine drive belt condition and tension as described in Cooling before beginning this procedure.

(1) Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Switch the compressor on and off several times to clearly identify the compressor noise. Listen to the compressor while the clutch is engaged and disengaged. Probe the compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.

(2) Loosen all of the compressor mounting hardware and retighten. Tighten the compressor clutch mounting nut. Be certain that the clutch coil is mounted securely to the compressor, and that the clutch plate and rotor are properly aligned and have the correct air gap (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH - INSTALLATION).

(3) To duplicate a high-ambient temperature condition (high head pressure), restrict the air flow through the condenser. Install a manifold gauge set or a DRBIII® scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).

(4) Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines for kinks or sharp bends that will restrict refrigerant flow, which can cause noises (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(5) If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE). If the high pressure relief valve still does not seat properly, replace the compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

(6) If the noise is from liquid slugging on the suction line, replace the accumulator (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - REMOVAL) and check the refrigerant oil level and the refrigerant system charge (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - REMOVAL). If after replacing the accumulator the slugging condition still exists then replace the compressor. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

(7) If the liquid slugging condition continues following accumulator replacement, replace the compressor and repeat Step 1.

REMOVAL

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch coil, engine, engine cylinder head or the generator.

(1) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REFRIGERANT SYSTEM EVACUATE).

A/C COMPRESSOR (Continued)

ING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Disconnect and isolate the battery negative cable.

(3) Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Disconnect the A/C compressor clutch coil wire harness connector.

(5) Depending on engine usage, remove the bolt or nuts that secure the suction and discharge line fittings to the A/C compressor.

(6) Disconnect the suction and discharge line fittings from the A/C compressor.

(7) Remove the O-ring seals from the suction and discharge line fittings and discard.

(8) Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

(9) If equipped with the 5.7L Hemi engine, remove the nuts and bolts that secure the generator and A/C compressor support bracket and remove the bracket from the engine.

(10) Remove the bolts that secure the A/C compressor to the mounting bracket (Fig. 4), (Fig. 5) or (Fig. 6).

(11) Remove the A/C compressor from the engine compartment.

INSTALLATION

NOTE: If a replacement compressor is being installed, be certain to check the refrigerant oil level. See Refrigerant Oil Level in this group for the procedures. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Install the compressor onto the mounting bracket.

(2) On the 3.7L and 4.7L engines, install and tighten the bolts in the following sequence (Fig. 7):

- Install the inner front bolt #3 and hand tightened.
- Install the outer front bolt #2 and hand tightened.
- Install the rear bolt #1 and hand tightened.
- Tightened the inner front bolt #3 to 40 N·m (30 ft. lbs.).
- Tightened the outer front bolt #2 to 55 N·m (41 ft. lbs.).
- Tightened the rear bolt #1 to 55 N·m (41 ft. lbs.).

80c6c6e5

(3) For the 5.7L Hemi engine, install and tighten the bolts in the following sequence (Fig. 8):

- Install the two long bolts into the mounting bracket and hand tightened.
- Install the rear bolt and hand tightened.

- Tightened the two long bolts to 40 N·m (30 ft. lbs.).
 - Tightened the rear bolt to 55 N·m (41 ft. lbs.).
- (4) For the 5.7L Hemi engine, install the generator and A/C compressor support bracket and retaining nuts and bolts. Tighten the nuts and bolts securely.

(5) For the 5.9L diesel engine, install and tighten the bolts in the following sequence (Fig. 9):

- Install the four bolts into the mounting bracket and hand tightened.
- Tightened the four bolts to 24 N·m (17 ft. lbs.).

(6) Remove the tape or plugs from the opened refrigerant line fittings and compressor ports.

(7) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the suction and discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(8) Install the suction and discharge line fittings onto the compressor.

(9) Install the bolt or nuts (depending on engine application) that secure the suction and discharge line fittings to the compressor. Tighten the bolt or nuts to 28 N·m (20 ft. lbs.).

(10) Connect the wire harness connector to the compressor clutch coil.

A/C COMPRESSOR (Continued)

Fig. 9 A/C Compressor - 5.9L Diesel

- 1 - ENGINE BLOCK
 2 - MOUNTING BRACKET
 3 - A/C COMPRESSOR
 4 - BOLT (4)

(11) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Reconnect the battery negative cable.

(13) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(14) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

A/C CONDENSER

DESCRIPTION

The condenser is located in the air flow next to the engine cooling radiator. The condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the compressor to give up its heat to the air passing over the condenser fins.

OPERATION

When air passes through the condenser fins, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the air conditioning system. There-

fore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

The A/C condenser cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

REMOVAL - 3.7, 4.7 AND 5.7L ENGINES

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(3) Remove the nut that secures the discharge line fitting to the condenser inlet port (Fig. 10).

(4) Disconnect the discharge line from the condenser.

(5) Remove the seal from the discharge line fitting and discard.

(6) Install plugs in, or tape over the discharge line fitting and condenser inlet port.

(7) Remove the plastic cover from the condenser outlet stud.

(8) Remove the nut that secures the liquid line fitting to the condenser outlet.

(9) Disconnect the liquid line from the condenser.

(10) Remove the seal from the liquid line fitting and discard.

(11) Install plugs in, or tape over the liquid line fitting and condenser outlet port.

(12) Disconnect the wire harness connector from the condenser cooling fan motor (Fig. 11).

(13) Remove the two bolts that secure the condenser to the front upper crossmember.

(14) Remove the condenser/cooling fan assembly from the vehicle.

(15) Place the condenser/cooling fan assembly on a flat work area and remove the four screws that secure the cooling fan to the condenser.

(16) Separate the cooling fan from the condenser.

REMOVAL - 5.9L DIESEL ENGINE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

- (1) Disconnect and isolate the battery negative cable.
- (2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).
- (3) Remove the plastic cover from the condenser inlet stud.
- (4) Remove the nut that secures the discharge line fitting to the condenser inlet port (Fig. 12).
- (5) Disconnect the discharge line from the condenser.
- (6) Remove the seal from the discharge line fitting and discard.
- (7) Install plugs in, or tape over the discharge line fitting and condenser inlet port.
- (8) Remove the plastic cover from the condenser outlet stud.
- (9) Remove the nut that secures the liquid line fitting to the condenser outlet.
- (10) Disconnect the liquid line from the condenser.
- (11) Remove the seal from the liquid line fitting and discard.
- (12) Install plugs in, or tape over the liquid line fitting and condenser inlet port.
- (13) Remove the four bolts that secure the condenser to the charge air cooler.
- (14) Remove the condenser from the engine compartment.

INSTALLATION

INSTALLATION - 3.7, 4.7 AND 5.7L ENGINES

NOTE: If the condenser is replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

- (1) Position the condenser cooling fan onto the A/C condenser.
- (2) Install and tighten the four screws that secure the condenser cooling fan to the A/C condenser. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (3) Carefully position the condenser/cooling fan assembly into the engine compartment.

A/C CONDENSER (Continued)

(4) Align the condenser lower mounting tabs to the mounting flanges.

(5) Install the two bolts that secure the condenser/cooling fan assembly to the upper front crossmember. Tighten the bolts to 10.5 N·m (95 in. lbs.).

(6) Connect the wire harness connector to the condenser cooling fan motor.

(7) Remove the tape or plugs from the liquid line fitting and condenser outlet port.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(9) Connect the liquid line to the condenser outlet port.

(10) Install and tighten the nut that secures the liquid line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(11) Install the plastic cover onto the condenser outlet stud.

(12) Remove the tape or plugs from the discharge line fitting and condenser inlet port.

(13) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(14) Connect the discharge line to the condenser inlet port.

(15) Install and tighten the nut that secures the discharge line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(16) Reconnect the battery negative cable.

(17) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(18) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

INSTALLATION - 5.9L DIESEL ENGINE

NOTE: If the condenser is replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Position the condenser into the engine compartment.

(2) Install the four bolts that secure the condenser to the charge air cooler. Tighten the bolts to 10.5 N·m (95 in. lbs.).

(3) Remove the tape or plugs from the liquid line fitting and condenser outlet port.

(4) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(5) Connect the liquid line to the condenser outlet port.

(6) Install and tighten the nut that secures the liquid line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(7) Install the plastic cover onto the condenser outlet stud.

(8) Remove the tape or plugs from the discharge line fitting and condenser inlet port.

(9) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

A/C CONDENSER (Continued)

(10) Connect the discharge line to the condenser inlet port.

(11) Install and tighten the nut that secures the discharge line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(12) Install the plastic cover onto the condenser inlet stud.

(13) Reconnect the battery negative cable.

(14) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(15) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

A/C CONDENSER FAN

REMOVAL - 3.7, 4.7 and 5.7L ENGINES

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(3) Remove the nut that secures the discharge line fitting to the condenser inlet port (Fig. 13).

(4) Disconnect the discharge line from the condenser.

(5) Remove the seal from the discharge line fitting and discard.

(6) Install plugs in, or tape over the discharge line fitting and condenser inlet port.

(7) Remove the plastic cover from the condenser outlet stud.

(8) Remove the nut that secures the liquid line fitting to the condenser outlet.

(9) Disconnect the liquid line from the condenser.

(10) Remove the seal from the liquid line fitting and discard.

(11) Install plugs in, or tape over the liquid line fitting and condenser inlet port.

(12) Disconnect the wire harness connector from the condenser cooling fan motor (Fig. 14).

(13) Remove the two bolts that secure the condenser to the front upper crossmember.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(9) Connect the liquid line to the condenser outlet port.

(10) Install and tighten the nut that secures the liquid line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(11) Install the plastic cover onto the condenser outlet stud.

(12) Remove the tape or plugs from the suction line fitting and condenser inlet port.

(13) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the suction line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(14) Connect the suction line to the condenser inlet port.

(15) Install and tighten the nut that secures the suction line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(16) Reconnect the battery negative cable.

(17) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(18) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

A/C DISCHARGE LINE

DESCRIPTION

The A/C discharge line is the refrigerant line that goes from the A/C compressor to the A/C condenser. The A/C discharge line for the 5.9L Diesel engine is serviced as an assembly with the suction line. The A/C discharge line has no serviceable parts except the rubber O-ring seals.

CAUTION: Use only O-ring seals specified for the vehicle. Failure to use correct O-ring seal will cause the refrigerant system connection to leak.

The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C discharge line is removed and installed.

If the A/C discharge line is found to be leaking or is damaged, it must be replaced.

REMOVAL

REMOVAL - 5.9L DIESEL ENGINE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(3) Disconnect the wire harness connector from the A/C pressure transducer.

(4) Remove the nut that secures the discharge line fitting to the condenser inlet port (Fig. 15).

(5) Disconnect the discharge line from the condenser.

(6) Remove the O-ring seal from the discharge line fitting and discard.

(7) Install plugs in, or tape over the discharge line fitting and condenser inlet port.

(8) Remove the bolt that secures the suction/discharge line assembly to the A/C compressor.

A/C DISCHARGE LINE (Continued)

(9) Disconnect the suction/discharge line assembly from the A/C compressor.

(10) Remove the O-ring seals from the suction and discharge line fittings and discard.

(11) Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

REMOVAL - 3.7L/4.7L AND 5.7L HEMI ENGINE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(3) Disconnect the wire harness connector from the A/C pressure transducer (Fig. 17) or (Fig. 18), depending on application.

(4) Remove the nut that secures the discharge line fitting to the condenser inlet port.

(5) Disconnect the discharge line from the condenser.

(6) Remove the O-ring seal from the discharge line fitting and discard.

A/C DISCHARGE LINE (Continued)

(7) Install plugs in, or tape over the discharge line fitting and condenser inlet port.

(8) Remove the nut that secures the discharge line fitting to the A/C compressor.

(9) Disconnect the discharge line from the compressor.

(10) Remove the O-ring seal from the discharge line fitting and discard.

(11) Install plugs in, or tape over the discharge line fitting and compressor outlet port.

(12) Remove the discharge line from the engine compartment.

(13) If necessary, remove the A/C pressure transducer from the discharge line.

(4) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the accumulator outlet tube fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(5) Connect the suction line to the accumulator outlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - INSTALLATION).

(6) Install the secondary retaining clip onto the spring-lock coupler that secures the suction line to the accumulator outlet tube.

(7) Remove the tape or plugs from the suction and discharge line fittings and the compressor ports.

(8) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the suction and discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(9) Connect the suction/discharge line assembly to the compressor.

(10) Install and tighten the bolt that secures the suction/discharge line assembly to the compressor. Tighten the bolt to 28 N·m (20 ft. lbs.).

A/C DISCHARGE LINE (Continued)

(11) Remove the tape or plugs from the discharge line fitting and condenser inlet port.

(12) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(13) Connect the discharge line to the condenser inlet port.

(14) Install and tighten the nut that secures the discharge line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(15) Connect the wire harness connector to the A/C pressure transducer.

(16) Reconnect the battery negative cable.

(17) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(18) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

INSTALLATION - 3.7L/4.7L AND 5.7L HEMI ENGINE

(1) If removed, install the A/C pressure transducer onto the discharge line using a new O-ring seal. Tighten the transducer securely.

(2) Position the discharge line into the engine compartment.

(3) Remove the tape or plugs from the discharge line fitting and the compressor outlet port.

(4) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(5) Connect the discharge line to the compressor.

(6) Install and tighten the nut that secures the discharge line to the compressor. Tighten the nut to 28 N·m (20 ft. lbs.).

(7) Remove the tape or plugs from the discharge line fitting and condenser inlet port.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(9) Connect the discharge line to the condenser inlet port.

(10) Install and tighten the nut that secures the discharge line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(11) Connect the wire harness connector to the A/C pressure transducer.

(12) Reconnect the battery negative cable.

(13) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(14) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

A/C EVAPORATOR**DESCRIPTION**

The A/C evaporator is located in the HVAC housing, behind the instrument panel. The evaporator is positioned in the HVAC housing so that all air that enters the housing must pass over the fins of the evaporator coils before it is distributed through the system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the compressor is engaged and circulating refrigerant through the evaporator tubes.

OPERATION

Refrigerant enters the A/C evaporator from the fixed orifice tube as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas before it leaves the A/C evaporator.

The A/C evaporator cannot be repaired and, if faulty or damaged, it must be replaced.

A/C EVAPORATOR (Continued)

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(2) Disassemble the HVAC housing to access the A/C evaporator (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY).

(3) Remove the evaporator temperature sensor probe from the A/C evaporator.

(4) Lift the A/C evaporator out of the HVAC housing (Fig. 19).

Fig. 19 A/C Evaporator - Typical

- 1 - PASSENGER SIDE BLEND DOOR LEVER
- 2 - PASSENGER SIDE BLEND DOOR
- 3 - EVAPORATOR TEMPERATURE SENSOR WIRE
- 4 - HVAC HOUSING
- 5 - A/C EVAPORATOR
- 6 - EVAPORATOR TEMPERATURE SENSOR PROBE
- 7 - DRIVER SIDE BLEND DOOR
- 8 - DRIVER SIDE BLEND DOOR LEVER

INSTALLATION

NOTE: If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Install the A/C evaporator into the HVAC housing. Make sure that the evaporator drain is clean and unrestricted and that the evaporator deflector shield is installed.

(2) Install the evaporator temperature sensor probe into the A/C evaporator.

(3) Assemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY).

(4) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

A/C ORIFICE TUBE

DESCRIPTION

The fixed A/C orifice tube (Fig. 20) is installed in the liquid line between the outlet of the condenser and the inlet of the evaporator. The A/C orifice tube is only serviced as an part of the liquid line.

Fig. 20 Fixed A/C Orifice Tube - Typical

- 1 - DIFFUSER SCREEN
- 2 - O-RING SEALS
- 3 - INLET FILTER SCREEN
- 4 - ORIFICE

OPERATION

The fixed A/C orifice tube is used to meter the flow of liquid refrigerant into the evaporator coil. The high-pressure liquid refrigerant from the condenser expands into a low-pressure liquid as it passes through the metering orifice and diffuser screen of the A/C orifice tube.

The A/C orifice tube is not serviceable. The A/C orifice tube cannot be repaired and, if faulty or plugged, it must be replaced as part of the liquid line.

A/C ORIFICE TUBE (Continued)

DIAGNOSIS AND TESTING - A/C ORIFICE TUBE

WARNING: THE LIQUID LINE BETWEEN THE CONDENSER OUTLET AND THE A/C ORIFICE TUBE CAN BECOME HOT ENOUGH TO BURN THE SKIN. USE EXTREME CAUTION WHEN PERFORMING THE FOLLOWING TEST.

NOTE: The A/C orifice tube can be checked for proper operation using the following procedure. However, the A/C orifice tube is only serviced as a part of the liquid line. If the results of this test indicate that the A/C orifice tube is obstructed or missing, the liquid line must be replaced.

(1) Confirm that the refrigerant system is properly charged. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE)

(2) Start the engine. Turn on the air conditioning system and confirm that the compressor clutch is engaged.

(3) Allow the air conditioning system to operate for five minutes.

(4) Lightly and cautiously touch the liquid line near the condenser outlet at the front of the engine compartment. The liquid line should be hot to the touch.

(5) Touch the liquid line near the evaporator inlet at the rear of the engine compartment. The liquid line should be cold to the touch.

(6) If there is a distinct temperature differential between the two ends of the liquid line, the A/C orifice tube is in good condition. If there is little or no detectable temperature differential between the two ends of the liquid line, the A/C orifice tube is obstructed or missing and the liquid line must be replaced.

ACCUMULATOR

DESCRIPTION

The accumulator (Fig. 21) is mounted in the engine compartment between the evaporator outlet and the compressor suction port. An integral mounting bracket is used to secure the accumulator to the dash panel.

The accumulator cannot be repaired and, if faulty or damaged, it must be replaced. The rubber O-rings are available for service replacement.

OPERATION

Refrigerant enters the accumulator canister as a low pressure vapor through the inlet tube. Any liquid, oil-laden refrigerant falls to the bottom of the

canister, which acts as a separator. A desiccant bag is mounted inside the accumulator canister to absorb any moisture which may have entered and become trapped within the refrigerant system.

REMOVAL

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITION-

ACCUMULATOR (Continued)

ING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(3) Remove the air filter housing cover to gain access to the accumulator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM).

(4) Remove the secondary retaining clip from the spring-lock coupler that secures the suction line to the accumulator outlet tube (Fig. 22).

(5) Using the proper A/C line disconnect tool, disconnect the suction line from the accumulator outlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - REMOVAL).

(6) Remove the O-ring seal from the accumulator outlet tube fitting and discard.

(7) Install plugs in, or tape over the opened suction line and the accumulator outlet tube fitting.

(8) Loosen the bolts that secure the accumulator to the bracket located on the dash panel.

(9) Remove the secondary retaining clip from the spring-lock coupler that secures the accumulator to the evaporator outlet tube.

(10) Using the proper A/C line disconnect tool, disconnect the accumulator inlet tube fitting from the evaporator outlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - REMOVAL).

(11) Remove the O-ring seal from the accumulator inlet tube fitting and discard.

(12) Install plugs in, or tape over the opened accumulator inlet tube fitting and the evaporator outlet tube.

(13) Remove the accumulator from the engine compartment.

INSTALLATION

NOTE: If the accumulator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Position the accumulator onto the dash panel bracket in the engine compartment. Do not tighten the bolts at this time.

(2) Remove the tape or plugs from the accumulator inlet tube fitting and the evaporator outlet tube.

(3) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the accumulator inlet tube fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(4) Connect the accumulator inlet tube fitting to the evaporator outlet tube (Refer to 24 - HEATING &

Fig. 22 A/C Accumulator - Typical

AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - INSTALLATION).

(5) Install the secondary retaining clip onto the spring-lock coupler that secures the accumulator inlet tube fitting to the evaporator outlet tube.

(6) Tighten the accumulator bracket bolts to 4.5 N-m (40 in. lbs.).

(7) Remove the tape or plugs from the suction line fitting and the accumulator outlet tube.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the accumulator outlet tube fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(9) Connect the suction line to the accumulator outlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - INSTALLATION).

(10) Install the secondary retaining clip onto the spring-lock coupler that secures the suction line to the accumulator outlet tube.

(11) Install the air filter housing cover to gain access to the accumulator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM).

ACCUMULATOR (Continued)

(12) Reconnect the battery negative cable.

(13) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(14) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

HEATER CORE

DESCRIPTION

The heater core is located in the HVAC housing, behind the instrument panel. It is a heat exchanger made of rows of tubes and fins.

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The blend door allows control of the heater output air temperature by regulating the amount of air flowing through the heater core within the HVAC housing. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Disassembly of the HVAC housing is not required to remove heater core.

(1) Remove the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(2) Remove the foam seal from the heater core tubes.

(3) If equipped with the Dual Zone system, remove the linkage rod from the actuator levers to gain access to the heater core (Fig. 23).

(4) Remove the two screws that secure the heater core tube bracket to the HVAC housing.

(5) Remove the heater core tube bracket.

(6) Pull the heater core out of the HVAC housing.

(7) Inspect all foam seals and repair or replace them as required.

8118eb45

Fig. 23 Heater Core – Dual Zone Shown, Single Zone Typical

- 1 - SCREWS
- 2 - TUBE BRACKET
- 3 - HEATER CORE
- 4 - LINKAGE ROD (IF EQUIPPED)

INSTALLATION

(1) Install the heater core into the HVAC housing.
 (2) Position the heater core tube bracket onto the HVAC housing.

(3) Install the two screws that secure the heater core bracket to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(4) If equipped with the Dual Zone system, install the linkage rod onto the actuator levers.

(5) Install the foam seal onto the heater core tubes.

(6) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

HEATER INLET HOSE

REMOVAL

The heater inlet hose is constructed from rubber hoses and plastic hose connectors. The ends are secured to the heater core, engine and engine coolant reservoir (depending on engine application) by spring tension clamps.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

(1) Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).

(2) Remove the heater hose retaining brackets as required (depending on engine application).

(3) Using spring tension clamp pliers, compress and slide the clamps off of each end of the hose being removed (Fig. 24).

CAUTION: DO NOT apply excessive pressure on heater tubes or connections when removing heater hoses. Excessive pressure may damage or deform the tubes/heater core, causing an engine coolant leak.

(4) Disconnect each hose end by carefully twisting the hose back and forth on the tube, while gently pulling it away from the end of the tube.

(5) If necessary, carefully cut the hose end and peel the hose off of the tube.

NOTE: Replacement of the heater inlet hose will be required if the hose ends are cut for removal.

(6) Remove the heater inlet hose from the engine compartment.

(7) Separate the heater hoses from each other as required (depending on engine application).

INSTALLATION

(1) If separated, reconnect the heater hoses to each other as required (depending on engine application).

(2) Position the heater inlet hose into the engine compartment.

(3) Using spring tension clamp pliers, compress and slide each clamp away from the end of the hose being installed.

(4) Install each hose by carefully twisting the hose back and forth while gently pushing it onto the tube end.

8118ee01

Fig. 24 Heater Hoses - Typical

- 5 - SPRING CLAMP
- 6 - HEATER RETURN HOSE

(5) Using spring tension clamp pliers, compress and slide the clamps onto each end of the hose being installed.

(6) Install the heater hose retaining brackets as required (depending on engine application).

(7) Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

HEATER RETURN HOSE

REMOVAL

The heater return hose is constructed from rubber hoses and plastic hose connectors. The ends are secured to the heater core, engine and engine coolant reservoir (depending on engine application) by spring tension clamps.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

HEATER RETURN HOSE (Continued)

(1) Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).

(2) Remove the heater hose retaining brackets as required (depending on engine application).

(3) Using spring tension clamp pliers, compress and slide the clamps off of each end of the hose being removed (Fig. 25).

CAUTION: DO NOT apply excessive pressure on heater tubes or connections when removing heater hoses. Excessive pressure may damage or deform the tubes/heater core, causing an engine coolant leak.

(4) Disconnect each hose end by carefully twisting the hose back and forth on the tube, while gently pulling it away from the end of the tube.

(5) If necessary, carefully cut the hose end and peel the hose off of the tube.

NOTE: Replacement of the heater return hose will be required if the hose ends are cut for removal.

(6) Remove the heater return hose from the engine compartment.

(7) Separate the heater hoses from each other as required (depending on engine application).

8118ee01

Fig. 25 Heater Hoses - Typical

- 1 - HEATER CORE TUBES
- 2 - HEATER INLET HOSE
- 3 - RETAINING BRACKET
- 4 - HOSE CONNECTOR
- 5 - SPRING CLAMP
- 6 - HEATER RETURN HOSE

INSTALLATION

(1) If separated, reconnect the heater hoses to each other as required (depending on engine application).

(2) Position the heater return hose into the engine compartment.

(3) Using spring tension clamp pliers, compress and slide each clamp away from the end of the hose being installed.

(4) Install each hose by carefully twisting the hose back and forth while gently pushing it onto the tube end.

(5) Using spring tension clamp pliers, compress and slide the clamps onto each end of the hose being installed.

(6) Install the heater hose retaining brackets as required (depending on engine application).

(7) Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

LIQUID LINE

DESCRIPTION

The liquid line is the refrigerant line that carries refrigerant from the A/C condenser to the evaporator. The liquid line for this model consist of two separate lines that connect to each other. The liquid lines are made from light-weight aluminum or steel, and use braze-less fittings.

The front half of the liquid line contains the fixed orifice tube. The liquid lines are only serviced as an assembly, except for the rubber O-ring seals used on the end fittings. The liquid lines cannot be adjusted or repaired and, if found to be leaking or damaged, they must be replaced.

REMOVAL

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

(1) Disconnect and isolate the battery negative cable.

(2) If equipped with the diesel engine, remove the passenger side battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(3) If equipped with the diesel engine, remove the passenger side battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).

(4) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITION-

LIQUID LINE (Continued)

ING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(5) Remove the plastic cover from the condenser outlet stud.

(6) Remove the nut that secures the liquid line fitting to the condenser outlet (Fig. 26).

(7) Disconnect the liquid line from the condenser.

(8) Remove the seal from the liquid line fitting and discard.

(9) Install plugs in, or tape over the liquid line fitting and condenser outlet port.

(10) Disengage the liquid lines from the body retaining clips.

(11) Remove the secondary retaining clip from the spring-lock coupler that secures the front section of the liquid line to the rear section of the liquid line.

(12) Using the proper A/C line disconnect tool, disconnect the front section of the liquid line from the rear section of the liquid line (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - REMOVAL).

(13) Remove the O-ring seal from the liquid line fitting and discard.

(14) Install plugs in, or tape over the opened front liquid line fitting and rear liquid line tube.

(15) Remove the secondary retaining clip from the spring-lock coupler that secures the liquid line to the evaporator inlet tube.

(16) Using the proper A/C line disconnect tool, disconnect the liquid line from the evaporator inlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - REMOVAL).

(17) Remove the O-ring seal from the liquid line fitting and discard.

(18) Install plugs in, or tape over the opened liquid line fitting and evaporator inlet tube.

(19) Remove both sections of the liquid line from the engine compartment.

INSTALLATION

(1) Position both sections of the liquid line into the engine compartment.

(2) Remove the tape or plugs from the rear liquid line fitting and the evaporator inlet tube.

(3) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the rear liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(4) Connect the liquid line fitting to the evaporator inlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - INSTALLATION).

80d646f

(5) Install the secondary retaining clip onto the spring-lock coupler that secures the liquid line fitting to the evaporator inlet tube.

(6) Remove the tape or plugs from the front liquid line fitting and the rear liquid line tube.

(7) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the front liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(8) Connect the front liquid line fitting to the rear liquid line tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - INSTALLATION).

(9) Install the secondary retaining clip onto the spring-lock coupler that secures the front liquid line fitting to the rear liquid line tube.

(10) Engage the liquid lines to the body retaining clips.

(11) Remove the tape or plugs from the liquid line fitting and condenser outlet port.

(12) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting. Use only the specified O-ring as it is made of a spe-

LIQUID LINE (Continued)

cial material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(13) Connect the liquid line to the condenser outlet port.

(14) Install and tighten the nut that secures the liquid line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(15) Install the plastic cover onto the condenser outlet stud.

(16) If equipped with the diesel engine, install the passenger side battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION).

(17) If equipped with the diesel engine, install the passenger side battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

(18) Reconnect the battery negative cables.

(19) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(20) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also

labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

REFRIGERANT LINE COUPLER

DESCRIPTION

Spring-lock type refrigerant line couplers are used to connect some of the refrigerant lines and other components to the refrigerant system. These couplers require a special tool for disengaging the two coupler halves.

OPERATION

The spring-lock coupler is held together by a garter spring inside a circular cage on the male half of the fitting (Fig. 27). When the two coupler halves are connected, the flared end of the female fitting slips behind the garter spring inside the cage on the male fitting. The garter spring and cage prevent the flared end of the female fitting from pulling out of the cage.

80a7e303

Fig. 27 Spring-Lock Coupler - Typical

- 1 - MALE HALF SPRING-LOCK COUPLER
- 2 - FEMALE HALF SPRING-LOCK COUPLER
- 3 - SECONDARY CLIP
- 4 - CONNECTION INDICATOR RING
- 5 - COUPLER CAGE
- 6 - GARTER SPRING
- 7 - COUPLER CAGE
- 8 - O-RING SEALS

Two O-rings on the male half of the fitting are used to seal the connection. These O-rings are compatible with R-134a refrigerant and must be replaced with O-rings made of the same material.

Secondary clips are installed over the two connected coupler halves at the factory for added protection. In addition, some models have a plastic ring that is used at the factory as a visual indicator to confirm that these couplers are connected. After the

REFRIGERANT LINE COUPLER (Continued)

coupler is connected, the plastic indicator ring is no longer required; however, it will remain on the refrigerant line near the coupler cage.

REMOVAL

(1) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE).

(2) Remove the secondary retaining clip from the spring-lock coupler.

(3) Fit the proper size A/C line disconnect tool (Special Tool Kit 7193 or equivalent) over the spring-lock coupler cage (Fig. 28).

Fig. 28 Refrigerant Line Spring-Lock Coupler Disconnect

(4) Close the two halves of the A/C line disconnect tool around the spring-lock coupler.

NOTE: The garter spring may not release if the A/C line disconnect tool is cocked while pushing it into the coupler cage opening.

(5) Push the A/C line disconnect tool into the open side of the coupler cage to expand the garter spring. Once the garter spring is expanded and while still pushing the disconnect tool into the open side of the coupler cage, pull on the refrigerant line attached to the female half of the coupler fitting until the flange on the female fitting is separated from the garter spring and cage on the male fitting within the disconnect tool.

(6) Open and remove the A/C line disconnect tool from the disconnected spring-lock coupler.

(7) Complete the separation of the two halves of the coupler fitting. Inspect the O-ring seals and mating areas for damage.

INSTALLATION

(1) Check to make sure that the garter spring is located within the cage of the male coupler fitting, and that the garter spring is not damaged.

(a) If the garter spring is missing, install a new spring by pushing it into the coupler cage opening.

(b) If the garter spring is damaged, remove it from the coupler cage with a small wire hook (DO NOT use a screwdriver) and install a new garter spring.

(2) Clean any dirt or foreign material from both halves of the coupler fitting.

CAUTION: Use only the specified O-rings as they are made of a special material for the R-134a system. The use of any other O-rings may allow the connection to leak intermittently during vehicle operation.

(3) Install new O-rings on the male half of the coupler fitting.

(4) Lubricate the male fitting and O-rings, and the inside of the female fitting with clean R-134a refrigerant oil. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(5) Fit the female half of the coupler fitting over the male half of the fitting.

(6) Push together firmly on the two halves of the coupler fitting until the garter spring in the cage on the male half of the fitting snaps over the flanged end on the female half of the fitting.

(7) Make sure that the spring-lock coupler is fully engaged by trying to separate the two coupler halves. This is done by pulling the refrigerant lines on either side of the coupler away from each other.

(8) Install the secondary retaining clip over the spring-lock coupler cage.

REFRIGERANT OIL**DESCRIPTION**

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. Two different type of A/C compressors are used in this vehicle depending on engine application. Both compressors are designed to use a PAG refrigerant oil. However, the PAG oil type differs between the two compressor

REFRIGERANT OIL (Continued)

designs. Use **only** refrigerant oil of the same type as recommended to service the refrigerant system (**always refer to the specification tag** included with the replacement A/C compressor or the underhood A/C system specification tag).

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage, and too much can reduce air conditioning system performance.

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

CAUTION: The refrigerant oil in the R-134a A/C system is unique depending on the A/C compressor used. Use only PAG oils that are designed to work with R-134a refrigerant and the A/C compressor in the vehicle. Always refer to the underhood A/C System Specification Label for the correct oil designation.

It is important to have the correct amount of lubricant in the A/C refrigerant system to ensure proper lubrication of the A/C compressor. Too little lubricant will result in damage to the compressor. Too much lubricant will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

The lubricant used in the compressor is polyalkylene glycol PAG lubricant. Only the refrigerant lubricant approved for use with this vehicle should be used to service the system. Do not use any other lubricant. The lubricant container should be kept tightly capped until it is ready for use. Refrigerant lubricant will quickly absorb any moisture it comes in contact with.

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been

an oil loss. An oil loss may occur due to component replacement, or a rupture or leak from a refrigerant line, connector fitting, component or component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of the recommended refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

COMPONENT REFRIGERANT OIL LEVEL CHECK

When an air conditioning system is first assembled at the factory, all components (except the A/C compressor) are refrigerant oil free. After the refrigerant system has been charged with (R-134a) refrigerant and operated, the oil in the A/C compressor is dispersed through the lines and components. The A/C evaporator, A/C condenser, and accumulator will retain a significant amount of oil. Refer to the A/C Component Refrigerant Oil Capacities table. When a component is replaced, the specified amount of refrigerant oil must be added. When a new A/C compressor is being installed, drain the lubricant from the used compressor, measure the amount drained and discard the used lubricant. Drain the lubricant from the new A/C compressor into a clean container. Return the amount of lubricant measured from the used compressor, plus the amount reclaimed from the system back into the new A/C compressor. When a line or component has ruptured and oil has escaped, the accumulator must be replaced along with the ruptured component.

A/C COMPONENT REFRIGERANT OIL CAPACITIES

Component	ml.	oz.
Total System Fill	180	6
Accumulator	60	2
Condenser	30	1
Evaporator	60	2
Compressor	Drain and measure the oil from the old compressor - see text.	

COMPRESSOR REFRIGERANT OIL LEVEL CHECK

NOTE: Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.

- (1) Recover the refrigerant from the system.

REFRIGERANT OIL (Continued)

(2) Disconnect the refrigerant lines from the A/C compressor. Cap open lines to prevent moisture from entering the system.

(3) Remove the A/C compressor from the vehicle.

(4) From the suction and discharge ports on the A/C compressor, drain the lubricant from the old A/C compressor into a clean container.

(5) From the suction and discharge ports on the A/C compressor, drain the lubricant from the new A/C compressor into a clean container.

(6) Install new lubricant back into the new A/C compressor in the amount measured from the used compressor, plus adding any amount of lubricant lost when the refrigerant system was reclaimed.

(7) Install the A/C compressor and connect the refrigerant lines. Then evacuate and charge refrigerant system.

SERVICE PORT VALVE CORE

DESCRIPTION

A/C SERVICE PORT VALVE CORES

The A/C service port valve cores are serviceable items. The A/C pressure transducer is mounted on the high side service port which is located on the discharge line near the A/C compressor. The low side service port is located on the suction line near the accumulator outlet tube.

REMOVAL - SERVICE PORT VALVE CORES

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

(1) Remove the protective cap from the low side service port as necessary.

(2) Remove the A/C pressure transducer from the high side service port as necessary (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C PRESSURE TRANSDUCER - REMOVAL).

(3) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE).

(4) Using a standard Schrader-type valve core tool, remove the valve core from the service ports as required.

(5) Install a plug in or tape over the opened service port(s).

INSTALLATION

(1) Lubricate the A/C service port valve core with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(2) Remove the tape or plug from the A/C service port.

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

(3) Using a standard Schrader-type valve core tool, install and tighten the replacement valve core into the A/C service ports as required.

(4) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(5) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

(6) Install the A/C pressure transducer to the high side service port as necessary (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C PRESSURE TRANSDUCER - INSTALLATION).

(7) Install the protective cap onto the A/C service ports as required.

SUCTION LINE

DESCRIPTION

The suction line is the refrigerant line that goes from the evaporator outlet tube to the compressor inlet port. The suction line for the 5.9L Diesel engine is only serviced as an assembly with the discharge line. The suction line has no serviceable parts except the rubber O-rings. If the suction line is found to be leaking or is damaged, it must be replaced.

REMOVAL

REMOVAL - 5.9L DIESEL ENGINE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION).

SUCTION LINE (Continued)

- (1) Disconnect and isolate the battery negative cable.
- (2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).
- (3) Disconnect the wire harness connector from the A/C pressure transducer.
- (4) Remove the nut that secures the discharge line fitting to the condenser inlet port (Fig. 29).
- (5) Disconnect the discharge line from the condenser.
- (6) Remove the O-ring seal from the discharge line fitting and discard.
- (7) Install plugs in, or tape over the discharge line fitting and condenser inlet port.
- (8) Remove the bolt that secures the suction/discharge line assembly to the A/C compressor.
- (9) Disconnect the suction/discharge line assembly from the A/C compressor.
- (10) Remove the O-ring seals from the suction and discharge line fittings and discard.
- (11) Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

- (12) Remove the secondary retaining clip from the spring-lock coupler that secures the suction line to the accumulator outlet tube (Fig. 30).
- (13) Using the proper A/C line disconnect tool, disconnect the suction line from the accumulator outlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - REMOVAL).
- (14) Remove the O-ring seal from the accumulator outlet tube fitting and discard.
- (15) Install plugs in, or tape over the opened suction line and the accumulator outlet tube fitting.
- (16) Remove the suction/discharge line assembly from the engine compartment.
- (17) If necessary, remove the A/C pressure transducer from the discharge line.

(10) Install plugs in, or tape over the opened suction line and the accumulator outlet tube fitting.

INSTALLATION

INSTALLATION - 5.9L DIESEL ENGINE

(1) If removed, install the A/C pressure transducer onto the discharge line using a new O-ring seal. Tighten the transducer securely.

(2) Position the suction/discharge line assembly into the engine compartment.

(3) Remove the tape or plugs from the suction line and the accumulator outlet tube fitting.

(4) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the accumulator outlet tube fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(5) Connect the suction line to the accumulator outlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - INSTALLATION).

(6) Install the secondary retaining clip onto the spring-lock coupler that secures the suction line to the accumulator outlet tube.

SUCTION LINE (Continued)

- 7 - SUCTION LINE
- 8 - A/C LOW PRESSURE SERVICE PORT
- 9 - A/C LINE SECONDARY RETAINING CLIP

(7) Remove the tape or plugs from the suction and discharge line fittings and the compressor ports.

(8) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the suction and discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(9) Connect the suction/discharge line assembly to the compressor.

(10) Install and tighten the bolt that secures the suction/discharge line assembly to the compressor. Tighten the bolt to 28 N·m (20 ft. lbs.).

(11) Remove the tape or plugs from the discharge line fitting and condenser inlet port.

(12) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(13) Connect the discharge line to the condenser inlet port.

(14) Install and tighten the nut that secures the discharge line fitting to the condenser. Tighten the nut to 20 N·m (180 in. lbs.).

(15) Connect the wire harness connector to the A/C pressure transducer.

(16) Reconnect the battery negative cable.

(17) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(18) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

INSTALLATION - 3.7L/4.7L AND 5.7L HEMI ENGINE

(1) Position the suction line into the engine compartment.

(2) Remove the tape or plugs from the suction line fitting and the compressor inlet port.

(3) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the suction line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(4) Connect the suction line to the compressor.

(5) Install and tighten the nut that secures the suction line to the compressor. Tighten the nut to 28 N·m (20 ft. lbs.).

(6) Remove the tape or plugs from the suction line and the accumulator outlet tube fitting.

(7) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the accumulator outlet tube fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(8) Connect the suction line to the accumulator outlet tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT LINE COUPLER - INSTALLATION).

(9) Install the secondary retaining clip onto the spring-lock coupler that secures the suction line to the accumulator outlet tube.

(10) Reconnect the battery negative cable.

(11) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(12) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

EMISSIONS CONTROL

DESCRIPTION

DESCRIPTION - STATE DISPLAY TEST MODE

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

DESCRIPTION - CIRCUIT ACTUATION TEST MODE

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device, its associated wiring, and driver circuit work correctly. Connect the DRB scan tool to the data link connector and access the Actuators screen.

DESCRIPTION - DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.

BULB CHECK

Each time the ignition key is turned to the ON position, the malfunction indicator (check engine) lamp on the instrument panel should illuminate for approximately 2 seconds then go out. This is done for a bulb check.

OBTAINING DTC'S USING DRB SCAN TOOL

- (1) Obtain the applicable Powertrain Diagnostic Manual.
- (2) Obtain the DRB Scan Tool.
- (3) Connect the DRB Scan Tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.
- (4) Turn the ignition switch on and access the "Read Fault" screen.
- (5) Record all the DTC's and "freeze frame" information shown on the DRB scan tool.
- (6) To erase DTC's, use the "Erase Trouble Code" data screen on the DRB scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

DESCRIPTION - TASK MANAGER

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is call the "Task Manager".

EMISSIONS CONTROL (Continued)

DESCRIPTION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator Lamp (MIL) will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the MIL or a scan tool.

The following is a list of the system monitors:

- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Leak Detection Pump Monitor (if equipped)

All these system monitors require two consecutive trips with the malfunction present to set a fault.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

The following is an operation and description of each system monitor :

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the Catalyst and Fuel Monitors.

The O2S can fail in any or all of the following manners:

- slow response rate
- reduced output voltage
- dynamic shift
- shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer

than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) shorted to voltage DTC, as well as a O2S heater DTC, the O2S fault MUST be repaired first. Before checking the O2S fault, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S sensor are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S sensor is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S sensor must be tested to ensure that it is heating the sensor properly.

The O2S sensor circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S sensor output voltage from the other effects.

LEAK DETECTION PUMP MONITOR (IF EQUIPPED)

The leak detection assembly incorporates two primary functions: it must detect a leak in the evaporative system and seal the evaporative system so the leak detection test can be run.

The primary components within the assembly are: A three port solenoid that activates both of the functions listed above; a pump which contains a switch, two check valves and a spring/diaphragm, a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

EMISSIONS CONTROL (Continued)

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

Pump Mode: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

Test Mode: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5" H2O. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .040" orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

After passing the leak detection phase of the test, system pressure is maintained by turning on the LDP's solenoid until the purge system is activated. Purge activation in effect creates a leak. The cycle rate is again interrogated and when it increases due to the flow through the purge system, the leak check portion of the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the O2 control system. If fuel vapor, indicated

by a shift in the O2 control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the Air Fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio of 14.7 to 1. This is done by making short term corrections in the fuel injector pulse width based on the O2S sensor output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual fuel-air ratio with the O2S sensor (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's sensor strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream

EMISSIONS CONTROL (Continued)

O₂S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O₂S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O₂S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O₂S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O₂S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O₂S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O₂S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O₂S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL will be illuminated.

DESCRIPTION - TRIP DEFINITION

The term "Trip" has different meanings depending on what the circumstances are. If the MIL (Malfunction Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it depends on what type of DTC is set to know what a "Trip" is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the "Similar Condition Window" for a specified amount of time to be considered a Good Trip.

If a Non-Continuous OBDII Monitor fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor, is considered to be a Good Trip. These will include the following:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

DESCRIPTION - COMPONENT MONITORS

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (MIL) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater, and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks, or any component that has an associated limp-in, will set a fault after 1 trip with the malfunction present. Components without an associated limp-in will take two trips to illuminate the MIL.

EMISSIONS CONTROL (Continued)

OPERATION

OPERATION

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the problem is repaired or ceases to exist, the PCM cancels the code after 40 warm-up cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). The MIL is displayed as an engine icon (graphic) on the instrument panel. Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16-way data link connector. The connector is located on the bottom edge of the instrument panel near the steering column (Fig. 1).

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, connect the DRB scan tool to the 16-way data link connector to erase all DTC's and extinguish the MIL.

OPERATION - TASK MANAGER

The Task Manager determines which tests happen when and which functions occur when. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task

Fig. 1 DATA LINK CONNECTOR LOCATION - TYPICAL

1 - 16-WAY DATA LINK CONNECTOR

Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

EMISSIONS CONTROL (Continued)

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the EGR Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

- Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the EGR monitor, the Task Manager may still run the EGR Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the EGR system is actually failing or if an Oxygen Sensor is failing.

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a third trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC era-

sure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 — Non-emissions related trouble codes
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire.
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire.
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault.
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire.

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ± 375 RPM and load is within $\pm 10\%$ of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a DRB III. Erasing the DTC with the DRB III erases all OBD II information. The DRB III automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

EMISSIONS CONTROL (Continued)

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Specific Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRB III)

- Comprehensive Components
- Major Monitor
- Warm-Up Cycles

Specific Good Trip

The term Good Trip has different meanings depending on the circumstances:

- If the MIL is OFF, a trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.
- If the MIL is ON and a DTC was set by the Fuel Monitor or Misfire Monitor (both continuous monitors), the vehicle must be operated in the Similar Condition Window for a specified amount of time.
- If the MIL is ON and a DTC was set by a Task Manager commanded once-per-trip monitor (such as the Oxygen Sensor Monitor, Catalyst Monitor, Purge Flow Monitor, Leak Detection Pump Monitor, EGR Monitor or Oxygen Sensor Heater Monitor), a good trip is when the monitor is passed on the next start-up.
- If the MIL is ON and any other emissions DTC was set (not an OBD II monitor), a good trip occurs when the Oxygen Sensor Monitor and Catalyst Monitor have been completed, or two minutes of engine run time if the Oxygen Sensor Monitor and Catalyst Monitor have been stopped from running.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRB III. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with the DRB III or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

EMISSIONS CONTROL (Continued)

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **Upstream O₂S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.

- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.

- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.

- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).

- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **200 Rev Counter** — Counts 0–100 720 degree cycles.

- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.

- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.

- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.

- **Misfire Data** — Data collected during test.

- **Test Done This Trip** — Indicates YES when the test is done.

OPERATION - NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. **EXAMPLE:** a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EMISSIONS CONTROL (Continued)

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

EVAPORATIVE EMISSIONS

DESCRIPTION - EVAP SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes into the two charcoal filled evaporative canisters. The canisters temporarily hold the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions.

All gasoline powered engines use a duty cycle purge system. The PCM controls vapor flow by operating the duty cycle EVAP purge solenoid. Refer to Duty Cycle EVAP Canister Purge Solenoid for additional information.

When equipped with certain emissions packages, a Leak Detection Pump (LDP) will be used as part of the evaporative system. This pump is used as a part of OBD II requirements. Refer to Leak Detection Pump for additional information. Other emissions packages will use a Natural Vacuum Leak Detection (NVLN) system in place of the LDP. Refer to NVLD for additional information.

NOTE: The hoses used in this system are specially manufactured. If replacement becomes necessary, it is important to use only fuel resistant hose.

Certain EVAP system components can be found in (Fig. 1).

CCV HOSE

DESCRIPTION - 8.0L V-10

The 8.0L V-10 engine is equipped with a Crankcase Ventilation (CCV) system. The CCV system performs the same function as a conventional PCV system, but does not use a vacuum controlled valve (PCV valve).

A molded vacuum tube connects manifold vacuum to the top of the right cylinder head (valve) cover. The vacuum tube connects to a fixed orifice fitting (Fig. 2) of a calibrated size 2.6 mm (0.10 inches).

Fig. 2 FIXED ORIFICE FITTING - 8.0L V-10 ENGINE - TYPICAL

- 1 - VACUUM TUBE
- 2 - FIXED ORIFICE FITTING
- 3 - COIL PACKS
- 4 - ORIFICE FITTING HOSE CONNECTIONS

OPERATION - 8.0L V-10

A molded vacuum tube connects manifold vacuum to the top of the right cylinder head (valve) cover. The vacuum tube connects to a fixed orifice fitting (Fig. 2) of a calibrated size 2.6 mm (0.10 inches). The fitting meters the amount of crankcase vapors drawn out of the engine. **The fixed orifice fitting is grey in color.** A similar fitting (but does not contain a fixed orifice) is used on the left cylinder head (valve) cover. This fitting is black in color. Do not interchange these two fittings.

When the engine is operating, fresh air enters the engine and mixes with crankcase vapors. Manifold vacuum draws the vapor/air mixture through the fixed orifice and into the intake manifold. The vapors are then consumed during engine combustion.

EVAP/PURGE SOLENOID

DESCRIPTION

The duty cycle EVAP canister purge solenoid is located in the engine compartment. It is attached to the side of the Power Distribution Center (PDC).

OPERATION

The Powertrain Control Module (PCM) operates the solenoid.

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM energizes and de-energizes the solenoid 5 or 10 times per second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time the solenoid energizes. The PCM adjusts solenoid pulse width based on engine operating condition.

REMOVAL

The duty cycle EVAP canister purge solenoid is located in the engine compartment. It is attached to the side of the Power Distribution Center (PDC) (Fig. 3).

- (1) Disconnect electrical wiring connector at solenoid.
- (2) Disconnect vacuum harness at solenoid (Fig. 3).
- (3) Remove solenoid from mounting bracket.

INSTALLATION

- (1) Install solenoid assembly to mounting bracket.
- (2) Connect vacuum harness.
- (3) Connect electrical connector.

FUEL FILLER CAP

DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. Certain models are equipped with a 1/4 turn cap.

OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with a Leak Detection Pump (LDP), or NVLD system, the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.

REMOVAL

REMOVAL/INSTALLATION

If replacement of the 1/4 turn fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

CAUTION: Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.

LEAK DETECTION PUMP

DESCRIPTION

Vehicles equipped with JTEC engine control modules use a leak detection pump. Vehicles equipped with NGC engine control modules use an NVLD pump. Refer to Natural Vacuum - Leak Detection (NVLD) for additional information.

The evaporative emission system is designed to prevent the escape of fuel vapors from the fuel system (Fig. 4). Leaks in the system, even small ones, can allow fuel vapors to escape into the atmosphere. Government regulations require onboard testing to make sure that the evaporative (EVAP) system is functioning properly. The leak detection system tests for EVAP system leaks and blockage. It also performs self-diagnostics. During self-diagnostics, the Powertrain Control Module (PCM) first checks the Leak Detection Pump (LDP) for electrical and mechanical faults. If the first checks pass, the PCM then uses the LDP to seal the vent valve and pump air into the system to pressurize it. If a leak is present, the PCM will continue pumping the LDP to replace the air that leaks out. The PCM determines the size of the leak based on how fast/long it must pump the LDP as it tries to maintain pressure in the system.

EVAP LEAK DETECTION SYSTEM COMPONENTS

Service Port: Used with special tools like the Miller Evaporative Emissions Leak Detector (EELD) to test for leaks in the system.

EVAP Purge Solenoid: The PCM uses the EVAP purge solenoid to control purging of excess fuel vapors stored in the EVAP canister. It remains closed during leak testing to prevent loss of pressure.

EVAP Canister: The EVAP canister stores fuel vapors from the fuel tank for purging.

EVAP Purge Orifice: Limits purge volume.

EVAP System Air Filter: Provides air to the LDP for pressurizing the system. It filters out dirt while allowing a vent to atmosphere for the EVAP system.

OPERATION

The main purpose of the LDP is to pressurize the fuel system for leak checking. It closes the EVAP system vent to atmospheric pressure so the system can be pressurized for leak testing. The diaphragm is powered by engine vacuum. It pumps air into the EVAP system to develop a pressure of about 7.5" H₂O (1/4) psi. A reed switch in the LDP allows the PCM to monitor the position of the LDP diaphragm. The PCM uses the reed switch input to monitor how fast the LDP is pumping air into the EVAP system. This allows detection of leaks and blockage. The LDP assembly consists of several parts (Fig. 5). The solenoid is controlled by the PCM, and it connects the

upper pump cavity to either engine vacuum or atmospheric pressure. A vent valve closes the EVAP system to atmosphere, sealing the system during leak testing. The pump section of the LDP consists of a diaphragm that moves up and down to bring air in through the air filter and inlet check valve, and pump it out through an outlet check valve into the EVAP system. The diaphragm is pulled up by engine vacuum, and pushed down by spring pressure, as the LDP solenoid turns on and off. The LDP also has a magnetic reed switch to signal diaphragm position to the PCM. When the diaphragm is down, the switch is closed, which sends a 12 V (system voltage) signal to the PCM. When the diaphragm is up, the switch is open, and there is no voltage sent to the PCM. This allows the PCM to monitor LDP pumping action as it turns the LDP solenoid on and off.

LEAK DETECTION PUMP (Continued)

LDP AT REST (NOT POWERED)

When the LDP is at rest (no electrical/vacuum) the diaphragm is allowed to drop down if the internal (EVAP system) pressure is not greater than the return spring. The LDP solenoid blocks the engine vacuum port and opens the atmospheric pressure port connected through the EVAP system air filter. The vent valve is held open by the diaphragm. This allows the canister to see atmospheric pressure (Fig. 6).

- 7 - Engine Vacuum (Closed)

80ce401e

DIAPHRAGM UPWARD MOVEMENT

When the PCM energizes the LDP solenoid, the solenoid blocks the atmospheric port leading through the EVAP air filter and at the same time opens the engine vacuum port to the pump cavity above the diaphragm. The diaphragm moves upward when vacuum above the diaphragm exceeds spring force. This upward movement closes the vent valve. It also causes low pressure below the diaphragm, unseating the inlet check valve and allowing air in from the EVAP air filter. When the diaphragm completes its upward movement, the LDP reed switch turns from closed to open (Fig. 7).

80ce4017

Fig. 7 DIAPHRAGM UPWARD MOVEMENT

- 2 - Inlet Check Valve (Open)
- 3 - Vent Valve (Closed)
- 4 - From Air Filter
- 5 - To Canister
- 6 - Outlet Check Valve (Closed)
- 7 - Engine Vacuum (Open)

DIAPHRAGM DOWNWARD MOVEMENT

Based on reed switch input, the PCM de-energizes the LDP solenoid, causing it to block the vacuum port, and open the atmospheric port. This connects the upper pump cavity to atmosphere through the EVAP air filter. The spring is now able to push the diaphragm down. The downward movement of the diaphragm closes the inlet check valve and opens the outlet check valve pumping air into the evaporative system. The LDP reed switch turns from open to closed, allowing the PCM to monitor LDP pumping (diaphragm up/down) activity (Fig. 8). During the pumping mode, the diaphragm will not move down far enough to open the vent valve. The pumping cycle is repeated as the solenoid is turned on and off. When the evaporative system begins to pressurize, the pressure on the bottom of the diaphragm will begin to oppose the spring pressure, slowing the pumping action. The PCM watches the time from when the solenoid is de-energized, until the diaphragm drops down far enough for the reed switch to change from opened to closed. If the reed switch changes too quickly, a leak may be indicated. The longer it takes the reed switch to change state, the tighter the evaporative system is sealed. If the system pressurizes too quickly, a restriction somewhere in the EVAP system may be indicated.

LEAK DETECTION PUMP (Continued)

- 5 - To Canister
- 6 - Outlet Check Valve (Open)
- 7 - Engine Vacuum (Closed)

PUMPING ACTION

Action : During portions of this test, the PCM uses the reed switch to monitor diaphragm movement. The solenoid is only turned on by the PCM after the reed switch changes from open to closed, indicating that the diaphragm has moved down. At other times during the test, the PCM will rapidly cycle the LDP solenoid on and off to quickly pressurize the system. During rapid cycling, the diaphragm will not move enough to change the reed switch state. In the state of rapid cycling, the PCM will use a fixed time interval to cycle the solenoid. If the system does not pass the EVAP Leak Detection Test, the following DTCs may be set:

- P0442 - EVAP LEAK MONITOR 0.040" LEAK DETECTED
- P0455 - EVAP LEAK MONITOR LARGE LEAK DETECTED
- P0456 - EVAP LEAK MONITOR 0.020" LEAK DETECTED
- P1486 - EVAP LEAK MON PINCHED HOSE FOUND
- P1494 - LEAK DETECTION PUMP SW OR MECH FAULT
- P1495 - LEAK DETECTION PUMP SOLENOID CIRCUIT

REMOVAL

The Leak Detection Pump (LDP) and LDP filter are attached to the front of the EVAP canister mounting bracket (Fig. 9). This is located near the front of the fuel tank. The LDP and LDP filter are replaced (serviced) as one unit.

- (1) Raise and support vehicle.
- (2) Carefully remove hose at LDP filter.
- (3) Remove LDP filter mounting bolt and remove from vehicle.
- (4) Carefully remove vapor/vacuum lines at LDP.
- (5) Disconnect electrical connector at LDP.
- (6) Remove LDP mounting bolt and remove LDP from vehicle.

80d4f4db

Fig. 9 LDP AND LDP FILTER LOCATION

- 4 - FILTER MOUNTING BOLT
- 5 - LDP FILTER
- 6 - CONNECTING HOSE
- 7 - EVAP CANISTER MOUNTING BRACKET
- 8 - EVAP CANISTERS (2)

INSTALLATION

The LDP and LDP filter are attached to the front of the EVAP canister mounting bracket. The LDP and LDP filter are replaced (serviced) as one unit.

- (1) Install LDP to mounting bracket. Refer to Torque Specifications.
- (2) Install LDP filter to mounting bracket. Refer to Torque Specifications.
- (3) Carefully install vapor/vacuum lines to LDP, and install hose to LDP filter. **The vapor/vacuum lines and hoses must be firmly connected.**

LEAK DETECTION PUMP (Continued)

Check the vapor/vacuum lines at the LDP, LDP filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.

(4) Connect electrical connector to LDP.

ORVR

DESCRIPTION

The ORVR (On-Board Refueling Vapor Recovery) system consists of a unique fuel tank, flow management valve, fluid control valve, one-way check valve and vapor canister.

OPERATION

The ORVR (On-Board Refueling Vapor Recovery) system is used to remove excess fuel tank vapors. This is done while the vehicle is being refueled.

Fuel flowing into the fuel filler tube (approx. 1" I.D.) creates an aspiration effect drawing air into the fuel fill tube. During refueling, the fuel tank is vented to the EVAP canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the EVAP canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapor flow is metered by the purge solenoid so that there is no, or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fuel fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve and on to the vapor canister. Vapor is absorbed in the EVAP canister until vapor flow in the lines stops. This stoppage occurs following fuel shut-off, or by having the fuel level in the tank rise high enough to close the control valve. This control valve contains a float that rises to seal the large diameter vent path to the EVAP canister. At this point in the refueling process, fuel tank pressure increases, the check valve closes (preventing liquid fuel from spitting back at the operator), and fuel then rises up the fuel filler tube to shut off the dispensing nozzle.

PCV VALVE

DESCRIPTION

3.7L V-6 / 4.7L V-8

The 3.7L V-6 and 4.7L V-8 engines are equipped with a closed crankcase ventilation system and a Positive Crankcase Ventilation (PCV) valve.

This system consists of:

- a PCV valve mounted to the oil filler housing (Fig. 10). The PCV valve is sealed to the oil filler housing with an o-ring.
- the air cleaner housing
- two interconnected breathers threaded into the rear of each cylinder head (Fig. 11).
- tubes and hoses to connect the system components.

- 1 - CRANKCASE BREATHERS (2)
- 2 - REAR OF ENGINE

5.7L V-8

The 5.7L V-8 engine is equipped with a closed crankcase ventilation system and a Positive Crankcase Ventilation (PCV) valve.

This system consists of:

- a PCV valve mounted into the top of the intake manifold, located to the right / rear of the throttle body (Fig. 12). The PCV valve is sealed to the intake manifold with 2 o-rings (Fig. 13).
- passages in the intake manifold.
- tubes and hoses to connect the system components.

5.9L V-8

The 5.9L V-8 engine is equipped with a closed crankcase ventilation system and a positive crankcase ventilation (PCV) valve.

This system consists of a PCV valve mounted on the cylinder head (valve) cover with a hose extending from the valve to the intake manifold (Fig. 14). Another hose connects the opposite cylinder head (valve) cover to the air cleaner housing to provide a source of clean air for the system. A separate crankcase breather/filter is not used.

PCV VALVE (Continued)

Fig. 14 PCV VALVE/HOSE - 5.9L V-8

- 1 - PCV VALVE
- 2 - PCV VALVE HOSE CONNECTIONS

OPERATION

The PCV system operates by engine intake manifold vacuum (Fig. 15). Filtered air is routed into the crankcase through the air cleaner hose. The metered air, along with crankcase vapors, are drawn through the PCV valve and into a passage in the intake manifold. The PCV system manages crankcase pressure and meters blow by gases to the intake system, reducing engine sludge formation.

Fig. 15 TYPICAL CLOSED CRANKCASE VENTILATION SYSTEM

- 1 - THROTTLE BODY
- 2 - AIR CLEANER
- 3 - AIR INTAKE
- 4 - PCV VALVE
- 5 - COMBUSTION CHAMBER
- 6 - BLOW-BY GASES
- 7 - CRANKCASE BREATHER/FILTER

The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.

When the engine is not operating or during an engine pop-back, the spring forces the plunger back against the seat (Fig. 16). This will prevent vapors from flowing through the valve.

Fig. 16 ENGINE OFF OR ENGINE BACKFIRE - NO VAPOR FLOW

During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve (Fig. 17). In this position there is minimal vapor flow through the valve.

Fig. 17 HIGH INTAKE MANIFOLD VACUUM - MINIMAL VAPOR FLOW

During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve (Fig. 18).

Fig. 18 MODERATE INTAKE MANIFOLD VACUUM - MAXIMUM VAPOR FLOW

PCV VALVE (Continued)

DIAGNOSIS AND TESTING - PCV VALVE - 3.7L V-6/ 4.7L V-8

(1) Disconnect PCV line/hose (Fig. 19) by disconnecting rubber connecting hose at PCV valve fitting.

(2) Remove PCV valve at oil filler tube by rotating PCV valve downward until locating tabs have been freed at cam lock (Fig. 19). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**

(3) After valve is removed, check condition of valve o-ring (Fig. 19). Also, PCV valve should rattle when shaken.

(4) Reconnect PCV valve to its connecting line/hose.

(5) Start engine and bring to idle speed.

(6) If valve is not plugged, a hissing noise will be heard as air passes through valve. Also, a strong vacuum should be felt with a finger placed at valve inlet.

(7) If vacuum is not felt at valve inlet, check line/hose for kinks or for obstruction. If necessary, clean out intake manifold fitting at rear of manifold. Do this by turning a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.

(8) **Do not attempt to clean the old PCV valve.**

(9) Return PCV valve back to oil filler tube by placing valve locating tabs (Fig. 19) into cam lock. Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.

(10) Connect PCV line/hose and connecting rubber hose to PCV valve.

(11) Disconnect rubber hose from fresh air fitting at air cleaner resonator box. Start engine and bring to idle speed. Hold a piece of stiff paper (such as a parts tag) loosely over the opening of the disconnected rubber hose.

(12) The paper should be drawn against the hose opening with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

(13) If vacuum is not present, disconnect each PCV system hose at top of each crankcase breather (Fig. 20). Check for obstructions or restrictions.

(14) If vacuum is still not present, remove each PCV system crankcase breather (Fig. 20) from each cylinder head. Check for obstructions or restrictions. If plugged, replace breather. Tighten breather to 12 N·m (106 in. lbs.) torque. Do not attempt to clean breather.

(15) If vacuum is still not present, disconnect each PCV system hose at each fitting, and at each check valve (Fig. 21). Check for obstructions or restrictions.

REMOVAL

3.7L V-6 / 4.7L V-8

The PCV valve is located on the oil filler tube (Fig. 22). Two locating tabs are located on the side of the valve (Fig. 22). These 2 tabs fit into a cam lock in the oil filler tube. An o-ring seals the valve to the filler tube.

(1) Disconnect PCV line/hose (Fig. 22) by disconnecting rubber hose at PCV valve fitting.

(2) Remove PCV valve at oil filler tube by rotating PCV valve downward (counter-clockwise) until locating tabs have been freed at cam lock (Fig. 22). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**

(3) After valve is removed, check condition of valve o-ring (Fig. 22).

5.7L V-8

The PCV valve is mounted into the top of the intake manifold, located to the right / rear of the throttle body (Fig. 12). The PCV valve is sealed to the intake manifold with 2 o-rings (Fig. 13).

(1) Remove PCV valve by rotating counter-clockwise 90 degrees until locating tabs have been freed. After tabs have cleared, pull valve straight up from intake manifold.

80b89905

Fig. 22 PCV VALVE/OIL FILLER TUBE LOCATION - 3.7L V-6 / 4.7L V-8

4 - OIL FILLER TUBE
5 - PCV LINE/HOSE
6 - PCV VALVE

(2) After valve is removed, check condition of 2 valve o-rings.

INSTALLATION

3.7L V6 / 4.7L V-8

The PCV valve is located on the oil filler tube. Two locating tabs are located on the side of the valve. These 2 tabs fit into a cam lock in the oil filler tube. An o-ring seals the valve to the filler tube.

(1) Return PCV valve back to oil filler tube by placing valve locating tabs into cam lock. Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.

(2) Connect PCV line/hose and rubber hose to PCV valve.

PCV VALVE (Continued)

5.7L V-8

- (1) Clean out intake manifold opening.
- (2) Check condition of 2 o-rings on PCV valve.
- (3) Apply engine oil to 2 o-rings.
- (4) Place PCV valve into intake manifold and rotate 90 degrees clockwise for installation.

VACUUM LINES

DESCRIPTION

A vacuum schematic for emission related items can be found on the vehicles VECI label. Refer to Vehicle Emission Control Information (VECI) Label for label location.

VAPOR CANISTER

DESCRIPTION

Two, maintenance free, EVAP canisters are used. Both canisters are mounted into a two-piece support bracket located near the front of the fuel tank (Fig. 23).

80d4f4cb

- 4 - FILTER MOUNTING BOLT
- 5 - LDP FILTER
- 6 - CONNECTING HOSE
- 7 - EVAP CANISTER MOUNTING BRACKET
- 8 - EVAP CANISTERS (2)

OPERATION

Two, maintenance free, EVAP canisters are used. The EVAP canisters are filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canisters are absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canisters. Fuel vapors are temporarily held in the canisters until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canisters to be purged at predetermined times and at certain engine operating conditions.

REMOVAL

Two, maintenance free, EVAP canisters are used. Both canisters are mounted into a two-piece support bracket located near the front of the fuel tank (Fig. 23).

- (1) Raise and support vehicle.
- (2) Remove fuel tubes/lines at each EVAP canister. Note location of tubes/lines before removal for easier installation.
- (3) Remove lower support bracket (Fig. 24).
- (4) Remove mounting nuts at top of each canister (Fig. 24).
- (5) Remove each canister from upper support bracket.

INSTALLATION

- (1) Place each canister into upper support bracket and install nuts. Refer to Torque Specifications.
- (2) Install lower support bracket. Refer to Torque Specifications.
- (3) Carefully install vapor/vacuum lines. **The vapor/vacuum lines and hoses must be firmly connected. Also check the vapor/vacuum lines at the LDP, LDP filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**

NATURAL VAC LEAK DETECTION ASSY

DESCRIPTION

Vehicles equipped with NGC engine control modules use an NVLD pump and system. Vehicles equipped with JTEC engine control modules use an LDP (leak detection pump). Refer to Leak Detection Pump (LDP) for additional information.

The NVLD pump is located in the same area as the leak detection pump. Refer to NVLD Removal / Installation for additional information.

OPERATION

Vehicles equipped with NGC engine control modules use an NVLD pump and system. Vehicles equipped with JTEC engine control modules use a leak detection pump. Refer to Leak Detection Pump (LDP) for additional information.

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC). This new system replaces the leak detection pump as the method of evaporative system leak detection. This is

to detect a leak equivalent to a 0.020" (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the "Gas Law". This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

A vent valve seals the canister vent during engine off conditions. If the vapor system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1" H₂O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies, utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

NATURAL VAC LEAK DETECTION ASSY (Continued)

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1" H₂O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3" to 6" H₂O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires initial 1.5 amps of current to pull the valve open but after 100 ms. will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will "blow off" at about 0.5" H₂O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to "breathe" during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

REMOVAL

The NVLD pump and filter are attached to the front of the EVAP canister mounting bracket (Fig. 25). This is located near the front of the fuel tank. The pump and filter are replaced (serviced) as one unit.

- (1) Raise and support vehicle.
- (2) Carefully remove pump hose clamp and hose at filter.
- (3) Carefully remove other vapor/vacuum hose at pump.
- (4) Disconnect 3-way electrical connector at pump.
- (5) The NVLD pump snaps onto the EVAP canister mounting bracket. Press on release tab (Fig. 26) while sliding pump from bracket.

NATURAL VAC LEAK DETECTION ASSY (Continued)

80f32863

Fig. 26 REMOVE / INSTALL NVLD PUMP

- 1 - NVLD PUMP
- 2 - RELEASE TAB

INSTALLATION

(1) Install NVLD pump to EVAP canister mounting bracket (snaps on).

(2) Install NVLD filter and bolt to EVAP canister mounting bracket. Refer to Torque Specifications.

(3) Carefully install vapor/vacuum lines to NVLD pump, and install hose to filter. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the NVLD pump, filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**

(4) Connect 3-way electrical connector to pump.

BLOWER MOTOR RESISTOR BLOCK - DESCRIPTION	24-18	BOX - REMOVAL, WITH CARGO	8L-22,8L-24, 8L-7,8L-9	BRAKE LAMP SWITCH - DIAGNOSIS AND TESTING	8L-10
BLOWER MOTOR RESISTOR BLOCK - DIAGNOSIS AND TESTING	24-19	BOX - REMOVAL, WITHOUT CARGO	8L-22, 8L-23,8L-24,8L-7,8L-9	BRAKE LAMP SWITCH - INSTALLATION	8L-11
BLOWER MOTOR RESISTOR BLOCK - INSTALLATION	24-19	BOX - TIE DOWN - INSTALLATION, CARGO	23-38	BRAKE LAMP SWITCH - OPERATION	8L-9
BLOWER MOTOR RESISTOR BLOCK - OPERATION	24-18	BOX - TIE DOWN - REMOVAL, CARGO	23-38	BRAKE LAMP SWITCH - REMOVAL	8L-10
BLOWER MOTOR RESISTOR BLOCK - REMOVAL	24-19	BOX LAMP/SWITCH - INSTALLATION, GLOVE	8L-28	BRAKE PROPORTIONING - DESCRIPTION, ELECTRONIC VARIABLE	5-49
BLOWER MOTOR SWITCH - DESCRIPTION	24-20	BOX LAMP/SWITCH - REMOVAL, GLOVE	8L-27	BRAKE PROPORTIONING - OPERATION, ELECTRONIC VARIABLE	5-49
BLOWER MOTOR SWITCH - DIAGNOSIS AND TESTING	24-20	BOX LATCH - INSTALLATION, GLOVE	23-52	BRAKE ROTOR, DIAGNOSIS AND TESTING - DISC	5-32
BLOWER MOTOR SWITCH - OPERATION	24-20	BOX LATCH - REMOVAL, GLOVE	23-52	BRAKE SHOES - ADJUSTMENT, PARKING	5-41
BODY - ADJUSTMENTS, VALVE	21-310	B-PILLAR GRAB HANDLE - INSTALLATION	23-68	BRAKE, SPECIFICATIONS - BASE	5-10
BODY - ASSEMBLY, VALVE	21-299,21-414	B-PILLAR GRAB HANDLE - REMOVAL	23-68	BRAKE SYSTEM - DIAGNOSIS AND TESTING, BASE	5-2
BODY & CABLE - DESCRIPTION, ANTENNA	8A-4	B-PILLAR LOWER TRIM - INSTALLATION	23-64	BRAKE TRANSMISSION SHIFT INTERLOCK - ADJUSTMENTS	21-196,21-365
BODY & CABLE - INSTALLATION, ANTENNA	8A-6	B-PILLAR LOWER TRIM - REMOVAL	23-63	BRAKE TRANSMISSION SHIFT INTERLOCK - DIAGNOSIS AND TESTING	21-196,21-364
BODY & CABLE - OPERATION, ANTENNA	8A-4	B-PILLAR UPPER TRIM - INSTALLATION	23-64	BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM - DESCRIPTION	21-196, 21-364
BODY & CABLE - REMOVAL, ANTENNA	8A-6	B-PILLAR UPPER TRIM - REMOVAL	23-64	BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM - OPERATION	21-196, 21-364
BODY - CLEANING, VALVE	21-298,21-412	BRACKET - INSTALLATION, REAR VIEW MIRROR SUPPORT	23-70	BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM - OPERATION	21-196, 21-364
BODY - DESCRIPTION, THROTTLE	14-36	BRACKET - INSTALLATION, STEERING COLUMN OPENING SUPPORT	23-60	BRAKE/PARK BRAKE INDICATOR - DESCRIPTION	8J-19
BODY - DESCRIPTION, VALVE	21-267,21-408	BRACKET - REMOVAL, STEERING COLUMN OPENING SUPPORT	23-60	BRAKE/PARK BRAKE INDICATOR - OPERATION	8J-19
BODY - DISASSEMBLY, VALVE	21-287,21-410	BRACKETS - INSTALLATION, SEAT BACK REAR - FOOTMANS LOOP	23-85	BRAKES - ABS - DESCRIPTION	5-45
BODY - INSPECTION, VALVE	21-298,21-413	BRACKETS - REMOVAL, SEAT BACK REAR - FOOTMANS LOOP	23-85	BRAKES - ABS - OPERATION	5-45
BODY - INSTALLATION, THROTTLE	14-37	BRAKE - CLEANING, REAR DRUM IN HAT	5-39	BRAKES, SPECIAL TOOLS - BASE	5-5
BODY - INSTALLATION, VALVE	21-309,21-414	BRAKE - DESCRIPTION, CONTROLLER ANTILOCK	8E-3	BREAK-IN - STANDARD PROCEDURE, A/C COMPRESSOR CLUTCH	24-10
BODY - OPERATION, THROTTLE	14-36	BRAKE - DESCRIPTION, PARKING	5-36	BREATHER - INSTALLATION, CRANKCASE	9-243
BODY - OPERATION, VALVE	21-272,21-408	BRAKE - INSPECTION, REAR DRUM IN HAT	5-39	BREATHER - REMOVAL, CRANKCASE	9-242
BODY - REMOVAL, THROTTLE	14-36	BRAKE - INSTALLATION, CONTROLLER ANTILOCK	8E-3	BUCKLE - INSTALLATION, FRONT OUTBOARD SEAT BELT	80-38
BODY - REMOVAL, VALVE	21-286,21-410	BRAKE - OPERATION, CONTROLLER ANTILOCK	8E-3	BUCKLE - REMOVAL, FRONT OUTBOARD SEAT BELT	80-37
BODY AND CABLE - DIAGNOSIS AND TESTING, ANTENNA	8A-4	BRAKE - OPERATION, PARKING	5-36	BUILT-IN INDICATOR TEST - STANDARD PROCEDURE	8F-10
BODY CODE PLATE - DESCRIPTION	Intro-3	BRAKE - REMOVAL, CONTROLLER ANTILOCK	8E-3	BUMPER - INSTALLATION, FRONT	13-2
BODY ISOLATORS - INSTALLATION	23-37	BRAKE BLEEDING - STANDARD PROCEDURE, ABS	5-46	BUMPER - INSTALLATION, JOUNCE	2-43
BODY ISOLATORS - REMOVAL	23-36	BRAKE BOOSTER - DESCRIPTION, POWER	5-29	BUMPER - INSTALLATION, REAR	13-4
BODY LUBRICATION - STANDARD PROCEDURE	23-3	BRAKE BOOSTER - INSTALLATION, HYDRO-BOOST	5-32	BUMPER - REMOVAL, FRONT	13-2
BODY OPENING DIMENSIONS - SPECIFICATIONS	23-99	BRAKE BOOSTER - INSTALLATION, POWER	5-29	BUMPER - REMOVAL, JOUNCE	2-43
BODY PANEL REPAIR - STANDARD PROCEDURE, PLASTIC	23-3			BUMPER - REMOVAL, REAR	13-3
BODY SIDE MOLDINGS - INSTALLATION	23-36			BUMPERS (3500) - INSTALLATION, AUXILIARY SPRING	2-43
BODY SIDE MOLDINGS - REMOVAL	23-36			BUMPERS (3500) - REMOVAL, AUXILIARY SPRING	2-43
BODY, SPECIAL TOOLS	23-14				
BODY VENT - INSTALLATION	23-71				
BODY VENT - REMOVAL	23-71				
BOOST PRESSURE - DIAGNOSIS AND TESTING, TURBOCHARGER	11-11				

Description	Group-Page	Description	Group-Page	Description	Group-Page
BURNT FLUID - DIAGNOSIS AND TESTING, CAUSES OF	21-201,21-366	CABLE, ADJUSTMENTS - GEARSHIFT	21-212, 21-370	CAPACITOR - DESCRIPTION, IGNITION COIL	81-21
BUSHING - INSTALLATION	19-19	CABLE RESISTANCE, SPECIFICATIONS - SPARK PLUG	81-4	CAPACITOR - INSTALLATION, IGNITION COIL	81-21
BUSHING - INSTALLATION, TORSION BAR CROSS MEMBER	2-15	CABLE ROUTING, 5.7L V-8 ENGINE - FIRING ORDER	81-4	CAPACITOR - OPERATION, IGNITION COIL	81-21
BUSHING - REMOVAL	19-19	CABLE/HANDLE ASSEMBLY - INSTALLATION, LATCH RELEASE	23-47	CAPACITOR - REMOVAL, IGNITION COIL	81-21
BUSHING - REMOVAL, TORSION BAR CROSSMEMBER	2-13	CABLE/HANDLE ASSEMBLY - REMOVAL, LATCH RELEASE	23-47	CAP-TO-FILLER NECK SEAL - DIAGNOSIS AND TESTING, RADIATOR	7-58
BUSHING AND SEAL - INSTALLATION, EXTENSION HOUSING	21-440	CABLES - DESCRIPTION, BATTERY	8F-14	CARDAN UNIVERSAL JOINTS - ASSEMBLY, DOUBLE	3-17
BUSHING AND SEAL - REMOVAL, EXTENSION HOUSING	21-440	CABLES - DIAGNOSIS AND TESTING, BATTERY	8F-15	CARDAN UNIVERSAL JOINTS - DISASSEMBLY, DOUBLE	3-16
BUSHINGS - 2WD (LD) - INSTALLATION, LOWER CONTROL ARM	2-15	CABLES - INSTALLATION, BATTERY	8F-17	CARGO BOX - INSTALLATION	23-37
BUSHINGS - 2WD (LD) - REMOVAL, LOWER CONTROL ARM	2-13	CABLES - OPERATION, BATTERY	8F-15	CARGO BOX - INSTALLATION, WITH	8L-22, 8L-23,8L-24,8L-7,8L-9
BUSHINGS - 4WD (LD) - INSTALLATION, LOWER CONTROL ARM	2-14	CABLES - REMOVAL, BATTERY	8F-16	CARGO BOX - INSTALLATION, WITHOUT	8L-22, 8L-23,8L-24,8L-8,8L-9
BUSHINGS - 4WD (LD) - REMOVAL, LOWER CONTROL ARM	2-13	CALIBRATION - STANDARD PROCEDURE, COMPASS	8M-3	CARGO BOX - REMOVAL	23-37
BUSHINGS - INSTALLATION	2-43	CALIPER ADAPTER MOUNT - INSTALLATION, DISC BRAKE	5-22	CARGO BOX - REMOVAL, WITH	8L-22,8L-24, 8L-7,8L-9
BUSHINGS - REMOVAL	2-43	CALIPERS - DESCRIPTION, DISC BRAKE	5-16	CARGO BOX - REMOVAL, WITHOUT	8L-22, 8L-23,8L-24,8L-7,8L-9
BUZZ, SQUEAK & RATTLE - STANDARD PROCEDURE	23-11	CAM BORE REPAIR - STANDARD PROCEDURE	9-267	CARGO BOX - TIE DOWN - INSTALLATION	23-38

PISTONS - DESCRIPTION	21-239,21-393	PORT VALVE CORES - REMOVAL, SERVICE	24-70	POWER MIRRORS - OPERATION	8N-10
PISTONS - INSPECTION	9-282	POSITION SENSOR - DESCRIPTION	21-442, 21-477	POWER MODULE - DESCRIPTION, INTEGRATED	8W-97-3
PISTONS - OPERATION	21-239,21-393	POSITION SENSOR - DESCRIPTION, ACCELERATOR PEDAL	14-22,14-68	POWER MODULE - INSTALLATION, INTEGRATED	8W-97-4
PITMAN ARM - INSTALLATION	19-37	POSITION SENSOR - DESCRIPTION, CAMSHAFT	14-71	POWER MODULE - OPERATION, INTEGRATED	8W-97-3
PITMAN ARM - REMOVAL	19-36	POSITION SENSOR - DESCRIPTION, CAMSHAFT	8I-7	POWER MODULE - REMOVAL, INTEGRATED	8W-97-3
PLANETARY GEARTRAIN - ASSEMBLY	21-397	POSITION SENSOR - DESCRIPTION, CRANKSHAFT	14-23,14-72	POWER OUTLET - DESCRIPTION	8W-97-7
PLANETARY GEARTRAIN - CLEANING	21-396	POSITION SENSOR - DESCRIPTION, THROTTLE	14-41	POWER OUTLET - DIAGNOSIS AND TESTING	8W-97-7
PLANETARY GEARTRAIN - DESCRIPTION	21-395	POSITION SENSOR - INSTALLATION	21-443, 21-478	POWER OUTLET - INSTALLATION	8W-97-8
PLANETARY GEARTRAIN - DISASSEMBLY	21-396	POSITION SENSOR - INSTALLATION, ACCELERATOR PEDAL	14-22,14-71	POWER OUTLET - OPERATION	8W-97-7
PLANETARY GEARTRAIN - INSPECTION	21-397	POSITION SENSOR - INSTALLATION, CAMSHAFT	14-72	POWER OUTLET - REMOVAL	8W-97-8
PLANETARY GEARTRAIN - OPERATION	21-396	POSITION SENSOR - INSTALLATION, CAMSHAFT	8I-10	POWER SEAT SYSTEM - DIAGNOSIS AND TESTING	8N-13
PLANETARY GEARTRAIN/OUTPUT SHAFT - ASSEMBLY	21-244	POSITION SENSOR - INSTALLATION, CRANKSHAFT	14-25,14-73	POWER SEAT TRACK - DESCRIPTION	8N-16
PLANETARY GEARTRAIN/OUTPUT SHAFT - DESCRIPTION	21-241	POSITION SENSOR - INSTALLATION, THROTTLE	14-43	POWER SEAT TRACK - DIAGNOSIS AND TESTING	8N-17
PLANETARY GEARTRAIN/OUTPUT SHAFT - DISASSEMBLY	21-242	POSITION SENSOR - OPERATION	21-442,21-477	POWER SEAT TRACK - INSTALLATION	8N-17
PLANETARY GEARTRAIN/OUTPUT SHAFT - INSPECTION	21-243	POSITION SENSOR - OPERATION, ACCELERATOR PEDAL	14-22,14-68	POWER SEAT TRACK - OPERATION	8N-16
PLANETARY GEARTRAIN/OUTPUT SHAFT - OPERATION	21-241	POSITION SENSOR - OPERATION, CAMSHAFT	14-71	POWER SEAT TRACK - REMOVAL	8N-17
PLASTIC BODY PANEL REPAIR - STANDARD PROCEDURE	23-3	POSITION SENSOR - OPERATION, CAMSHAFT	8I-7	POWER SEATS - DESCRIPTION	8N-13
PLATE - DESCRIPTION, BODY CODE	Intro-3	POSITION SENSOR - OPERATION, CRANKSHAFT	14-23,14-72	POWER SEATS - OPERATION	8N-13
PLATE - DESCRIPTION, ENGINE DATA	9-248	POSITION SENSOR - OPERATION, THROTTLE	14-41	POWER STEERING FLOW AND PRESSURE - DIAGNOSIS AND TESTING	19-4
PLATE - INSTALLATION, FLEX	9-138,9-210,9-48	POSITION SENSOR - REMOVAL	21-443,21-478	POWER STEERING FLUID - DESCRIPTION	0-3
PLATE - INSTALLATION, FRONT SKID	13-23	POSITION SENSOR - REMOVAL, ACCELERATOR PEDAL	14-22,14-68	POWER STEERING FLUID LEVEL CHECKING - STANDARD PROCEDURE	19-43
PLATE - INSTALLATION, SUPPORT	5-36	POSITION SENSOR - REMOVAL, CAMSHAFT	14-72	POWER STEERING GEAR, SPECIAL TOOLS	19-23
PLATE - INSTALLATION, TRANSFER CASE SKID	13-26	POSITION SENSOR - REMOVAL, CAMSHAFT	8I-9	POWER STEERING GEAR, SPECIFICATIONS	19-22
PLATE - REMOVAL, FLEX	9-138,9-210,9-48	POSITION SENSOR - REMOVAL, CRANKSHAFT	14-24,14-73	POWER STEERING PRESSURE SWITCH - DESCRIPTION	19-46
PLATE - REMOVAL, FRONT SKID	13-23	POSITION SENSOR - REMOVAL, THROTTLE	14-41	POWER STEERING PRESSURE SWITCH - OPERATION	19-46
PLATE - REMOVAL, SUPPORT	5-35	POSITION SWITCH - DESCRIPTION, CLUTCH PEDAL	6-13	POWER STEERING PUMP - INITIAL OPERATION - STANDARD PROCEDURE	19-40
PLATE - REMOVAL, TRANSFER CASE SKID	13-26	POSITION SWITCH - DIAGNOSIS AND TESTING, CLUTCH PEDAL	6-13	POWER STEERING SYSTEM - DIAGNOSIS AND TESTING	19-2
PLATE LAMP - INSTALLATION, LICENSE	8L-17	POSITION SWITCH - OPERATION, CLUTCH PEDAL	6-13	POWER STEERING SYSTEM - STANDARD PROCEDURE, FLUSHING	19-40
PLATE LAMP - REMOVAL, LICENSE	8L-17	POTENTIAL - STANDARD PROCEDURE, TESTING OF VOLTAGE	8W-01-9	POWER WINDOWS - DESCRIPTION	8N-19
PLATE LAMP UNIT - INSTALLATION, LICENSE	8L-17	POWER - INSTALLATION, WINDOW REGULATOR	23-26,23-34	POWER WINDOWS - DIAGNOSIS AND TESTING	8N-19
PLATES - INSTALLATION, EXTERIOR NAME	23-38	POWER - REMOVAL, WINDOW REGULATOR	23-25,23-34	POWER WINDOWS - OPERATION	8N-19
PLATES - REMOVAL, EXTERIOR NAME	23-38	POWER BRAKE BOOSTER - DESCRIPTION	5-29	POWERING SEVERAL LOADS - STANDARD PROCEDURE, TESTING FOR A SHORT TO GROUND ON FUSES	8W-01-10
PLUG - DESCRIPTION, SPARK	8I-17	POWER BRAKE BOOSTER - INSTALLATION	5-29	PRE-ALIGNMENT INSPECTION - DIAGNOSIS AND TESTING	2-2
PLUG - INSTALLATION, CAMSHAFT CORE HOLE	9-206	POWER BRAKE BOOSTER - OPERATION	5-29	PRESSURE - DIAGNOSIS AND TESTING, CHECKING ENGINE OIL	9-152,9-220,9-65
PLUG - REMOVAL, CAMSHAFT CORE HOLE	9-205	POWER BRAKE BOOSTER - REMOVAL	5-29	PRESSURE - DIAGNOSIS AND TESTING, CYLINDER COMPRESSION	9-186,9-8,9-93
PLUG - REMOVAL, SPARK	8I-19	POWER DISTRIBUTION - DESCRIPTION	8W-97-1	PRESSURE - DIAGNOSIS AND TESTING, ENGINE OIL	9-289
PLUG CABLE - DESCRIPTION, SPARK	8I-21	POWER DISTRIBUTION - OPERATION	8W-97-1	PRESSURE - DIAGNOSIS AND TESTING, POWER STEERING FLOW	19-4
PLUG CABLE - INSTALLATION, SPARK	8I-22	POWER DISTRIBUTION SYSTEMS, SPECIAL TOOLS	8W-97-2	PRESSURE - DIAGNOSIS AND TESTING, TURBOCHARGER BOOST	11-11
PLUG CABLE - OPERATION, SPARK	8I-21	POWER GROUNDS - DESCRIPTION	8E-10	PRESSURE BLEEDING - STANDARD PROCEDURE	5-5
PLUG CABLE - REMOVAL, SPARK	8I-22	POWER LOCK SWITCH - DIAGNOSIS AND TESTING	8N-4	PRESSURE CAP - DESCRIPTION, RADIATOR	7-57
PLUG CABLE RESISTANCE, SPECIFICATIONS - SPARK	8I-4	POWER LOCK SWITCH - INSTALLATION	8N-4	PRESSURE CAP - OPERATION, RADIATOR	7-58
PLUG CONDITIONS - DIAGNOSIS AND TESTING, SPARK	8I-17	POWER LOCK SWITCH - REMOVAL	8N-4	PRESSURE FOR HIGH SPEEDS - DESCRIPTION, TIRE	22-7
PLUGS - INSTALLATION, CORE	9-131			PRESSURE GAUGE - DESCRIPTION, OIL	8J-33
PLUGS - REMOVAL, CORE	9-131			PRESSURE GAUGE - OPERATION, OIL	8J-33
PLUGS, SPECIFICATIONS - SPARK	8I-4			PRESSURE GAUGES - DIAGNOSIS AND TESTING	22-7

RELAY - DESCRIPTION, TRANSMISSION CONTROL	21-405	REMINDER PROGRAMMING - STANDARD PROCEDURE, ENHANCED SEATBELT	8J-35	RESTRAINT ANCHOR - OPERATION, CHILD	80-17
RELAY - DESCRIPTION, WIPER HIGH/LOW	8R-20	REMOTE - INSTALLATION, RELEASE HANDLE/LATCH	23-17	RESTRAINT ANCHOR - REMOVAL, CHILD	80-17
RELAY - DESCRIPTION, WIPER ON/OFF	8R-24	REMOTE - REMOVAL, RELEASE HANDLE/LATCH	23-17	RESTRAINT DEPLOYMENT - STANDARD PROCEDURE, SERVICE AFTER A SUPPLEMENTAL	80-7
RELAY - DIAGNOSIS AND TESTING, PARK LAMP	8L-20	REMOTE KEYLESS ENTRY MODULE - DESCRIPTION	8N-7	RESTRAINT SYSTEM - DIAGNOSIS AND TESTING, SUPPLEMENTAL	80-6
RELAY - DIAGNOSIS AND TESTING, STARTER	8F-36	REMOTE KEYLESS ENTRY MODULE - DIAGNOSIS AND TESTING	8N-7	RESTRAINT SYSTEM - WARNINGS	80-5
RELAY - DIAGNOSIS AND TESTING, WIPER HIGH/LOW	8R-21	REMOTE KEYLESS ENTRY MODULE - INSTALLATION	8N-8	RESTRAINTS - DESCRIPTION	80-2
RELAY - DIAGNOSIS AND TESTING, WIPER ON/OFF	8R-25	REMOTE KEYLESS ENTRY MODULE - OPERATION	8N-7	RESTRAINTS - OPERATION	80-4
RELAY - INSTALLATION, A/C COMPRESSOR CLUTCH	24-14	REMOTE KEYLESS ENTRY MODULE - REMOVAL	8N-7	RESTRAINTS - STANDARD PROCEDURE, HANDLING NON-DEPLOYED SUPPLEMENTAL	80-6
RELAY - INSTALLATION, FOG LAMP	8L-13	REMOTE KEYLESS ENTRY TRANSMITTER - DIAGNOSIS AND TESTING	8N-8	RETAINER - ASSEMBLY, OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON	21-237
RELAY - INSTALLATION, FUEL HEATER	14-53	REMOTE KEYLESS ENTRY TRANSMITTER - SPECIFICATIONS	8N-9	RETAINER - CLEANING, OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON	21-236
RELAY - INSTALLATION, FUEL PUMP	14-28	REMOTE SWITCHES - DESCRIPTION	8A-10	RETAINER - DESCRIPTION, OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON	21-236
RELAY - INSTALLATION, INTAKE AIR HEATER	14-82	REMOTE SWITCHES - DIAGNOSIS AND TESTING	8A-11	RETAINER - DISASSEMBLY, OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON	21-236
RELAY - INSTALLATION, PARK LAMP	8L-21	REMOTE SWITCHES - INSTALLATION	8A-12	RETAINER - INSPECTION, OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON	21-237
RELAY - INSTALLATION, REAR WINDOW DEFOGGER	8G-4	REMOTE SWITCHES - OPERATION	8A-11	RETAINER - INSTALLATION, A-PILLAR WEATHERSTRIP	23-91
RELAY - INSTALLATION, STARTER MOTOR	8F-37	REMOTE SWITCHES - REMOVAL	8A-12	RETAINER - INSTALLATION, CRANKSHAFT REAR OIL SEAL	9-210,9-277
RELAY - INSTALLATION, WIPER HIGH/LOW	8R-22	REMOVAL/INSTALLATION, REMOVAL	14-52, 14-57,14-66	RETAINER - INSTALLATION, DRIP RAIL WEATHERSTRIP	23-92
RELAY - INSTALLATION, WIPER ON/OFF	8R-26	REPAIR - DESCRIPTION, THREADED HOLE	Intro-8	RETAINER - OPERATION, OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON	21-236
RELAY - OPERATION, A/C COMPRESSOR CLUTCH	24-13	REPAIR - STANDARD PROCEDURE, ALUMINUM THREAD	21-158,21-318	RETAINER - REMOVAL, A-PILLAR WEATHERSTRIP	23-91
RELAY - OPERATION, FOG LAMP	8L-13	REPAIR - STANDARD PROCEDURE, CAM BORE	9-267	RETAINER - REMOVAL, CRANKSHAFT REAR OIL SEAL	9-209,9-277
RELAY - OPERATION, FUEL HEATER	14-52	REPAIR - STANDARD PROCEDURE, CYLINDER BORE	9-265	RETAINER - REMOVAL, DRIP RAIL WEATHERSTRIP	23-92
RELAY - OPERATION, FUEL PUMP	14-27	REPAIR - STANDARD PROCEDURE, GRID LINE AND TERMINAL	8G-4	RETAINER/BULKHEAD - ASSEMBLY, 4C	21-363
RELAY - OPERATION, INTAKE AIR HEATER	14-82	REPAIR - STANDARD PROCEDURE, HYDROFORM FENDER RAIL	13-11	RETAINER/BULKHEAD - DISASSEMBLY, 4C	21-362
RELAY - OPERATION, PARK LAMP	8L-20	REPAIR - STANDARD PROCEDURE, PLASTIC BODY PANEL	23-3	RETRACTOR - DESCRIPTION, AUTOMATIC LOCKING	80-14
RELAY - OPERATION, REAR WINDOW DEFOGGER	8G-3	REPAIR DAMAGED OR WORN THREADS - STANDARD PROCEDURE	9-190,9-240,9-9,9-94	RETRACTOR - INSTALLATION, FRONT CENTER SEAT BELT	80-29
RELAY - OPERATION, STARTER MOTOR	8F-36	REPAIRING LEAKS - STANDARD PROCEDURE	22-10	RETRACTOR - INSTALLATION, REAR CENTER SEAT BELT	80-45
RELAY - OPERATION, TRANSMISSION CONTROL	21-405	REQUIREMENTS - DESCRIPTION, ENGINE COOLING SYSTEM	24-1	RETRACTOR - INSTALLATION, REAR OUTBOARD SEAT BELT	80-47
RELAY - OPERATION, WIPER HIGH/LOW	8R-20	REQUIREMENTS - DIESEL ENGINE - DESCRIPTION, FUEL	0-1	RETRACTOR - OPERATION, AUTOMATIC LOCKING	80-14
RELAY - OPERATION, WIPER ON/OFF	8R-25	RESERVOIR - DESCRIPTION, VACUUM	8P-9	RETRACTOR - REMOVAL, FRONT CENTER SEAT BELT	80-29
RELAY - REMOVAL, A/C COMPRESSOR CLUTCH	24-14	RESERVOIR - DESCRIPTION, WASHER	8R-14	RETRACTOR - REMOVAL, REAR CENTER SEAT BELT	80-44
RELAY - REMOVAL, FOG LAMP	8L-13	RESERVOIR - DIAGNOSIS AND TESTING, VACUUM	8P-9	RETRACTOR - REMOVAL, REAR OUTBOARD SEAT BELT	80-46
RELAY - REMOVAL, FUEL HEATER	14-52	RESERVOIR - INSTALLATION	19-47	RETURN - DESCRIPTION, SENSOR	8E-10
RELAY - REMOVAL, FUEL PUMP	14-28	RESERVOIR - INSTALLATION, FLUID	5-24	RETURN HOSE - GEAR TO COOLER - INSTALLATION	19-44,19-45
RELAY - REMOVAL, INTAKE AIR HEATER	14-82	RESERVOIR - INSTALLATION, VACUUM	8P-10	RETURN HOSE - GEAR TO COOLER - REMOVAL	19-44,19-45
RELAY - REMOVAL, PARK LAMP	8L-21	RESERVOIR - OPERATION, VACUUM	8P-9	RETURN HOSE - INSTALLATION, HEATER	24-65
RELAY - REMOVAL, REAR WINDOW DEFOGGER	8G-3	RESERVOIR - OPERATION, WASHER	8R-15	RETURN HOSE - REMOVAL, HEATER	24-64
RELAY - REMOVAL, STARTER MOTOR	8F-37	RESERVOIR - REMOVAL	19-47	RETURN HOSE - RESERVOIR TO COOLER - INSTALLATION	19-44,19-45
